APERÇU MONDIAL

1. Superficie, densité, population selon le sexe et taux d'accroissement de la population dans chaque pays et territoire du monde : dernier recensement et estimations au milieu de l'année pour 1953 et 1960	101
2. Superficie, densité, population selon le sexe et taux d'accroissement de la population dans chaque pays et territoire du monde : dernier recensement et estimations au milieu de l'année pour 1953 et 1960	120
3. Aperçu du mouvement de la population : quelques pays, dernière année pour laquelle on possède des données	121

Table *Page*

POPULATION

4. Estimates of midyear population: 1941-1961 .. 126

5. Population by age and sex: latest available year, 1957-1961 138

NATALITY

6. Live births, 1952-1961 and crude live birth rates, 1945-59 and 1952-1961 162

7. Live birth by age of mother: latest available year 178

FOETAL MORTALITY

8. Late foetal deaths 1952-1960 and late foetal death ratios 1945-59 and 1952-1960 186

9. Late foetal deaths by sex and illegitimacy percentages: 1952-1960 196

10. Foetal deaths and foetal death ratios by gestational age: 1952-1960 208

PERINATAL MORTALITY

11. Perinatal deaths and perinatal death ratios: 1952-1960 216

INFANT MORTALITY

12. Infant deaths, 1952-1961 and infant mortality rates, 1945-59 and 1952-1961 222

13. Infant mortality rates by age and sex: 1952-1960. 236

GENERAL MORTALITY

14. Deaths, 1952-1961, and crude death rates, 1945-59 and 1952-1961 264

15. Deaths by age and sex: 1955-1960 280

16. Death rates specific for age and sex: 1952-1960 . 360

17. Death and death rates by cause, and percentage medically certified: 1955-1960 398

Tableaux *Pages*

POPULATION

4. Estimations de la population au milieu de l'année : 1941-1961 126

5. Population selon l'âge et le sexe : dernière année disponible, 1957-1961 138

NATALITE

6. Naissances vivantes 1952-1961 et taux bruts de natalité 1945-59 et 1952-1961 162

7. Naissances vivantes selon l'âge de la mère : dernière année disponible 178

MORTALITE FŒTALE

8. Morts fœtales tardives 1952-1960 et rapports de mortinatalité 1945-59 et 1952-1960 186

9. Mortinatalité tardive selon le sexe et pourcentages des mortinaissances illégitimes : 1952-1960 196

10. Morts fœtales et rapports de mortalité fœtale selon la durée de la gestation : 1952-1960 208

MORTALITE PERINATALE

11. Morts périnatales et rapports de périnatalité : 1952-1960 216

MORTALITE INFANTILE

12. Décès d'enfants de moins d'un an 1952-1961 et taux de mortalité infantile 1945-59 et 1952-1961 222

13. Taux de mortalité infantile selon l'âge et le sexe : 1952-1960 236

MORTALITE GENERALE

14. Décès 1952-1961 et taux bruts de mortalité 1945-59 et 1952-1961 264

15. Décès selon l'âge et le sexe : 1955-1960 280

16. Taux de mortalité selon l'âge et le sexe : 1952-1960 360

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale : 1955-1960 ... 398

Table *Page*

GENERAL MORTALITY (continued)

18. Deaths by cause, age and sex: latest available year 472

19. Death rates by cause, specific for age and sex: latest available year 530

20. Deaths by marital status, age and sex: latest available year 572

21. Death rates specific for marital status, age and sex: latest available year 586

22. Male deaths by occupation and age: 1957-1960 . 596

23. Male death rates specific for occupation and age: latest available year 619

LIFE TABLES

24. Expectation of life at specified ages for each sex: 1940-1960 622

25. Life table mortality rates at specified age for each sex: 1940-1960 642

26. Survivors at specified ages for each sex: 1940-1960 658

MARRIAGE

27. Marriages and crude marriage rates: 1952-1961 . 676

28. Marriages by age of bride and by age of groom: latest available year 686

DIVORCE

29. Divorces and crude divorces rates: 1952-1961 .. 696

CUMULATIVE TABLE OF CONTENTS 702

MORTALITE GENERALE (suite)

18. Décès selon la cause, l'âge et le sexe: dernière année disponible 472

19. Taux de mortalité selon la cause, l'âge et le sexe: dernière année disponible 530

20. Décès selon l'état matrimonial, l'âge et le sexe: dernière année disponible 572

21. Taux de mortalité selon l'état matrimonial, l'âge et le sexe: dernière année disponible 586

22. Décès selon la profession et l'âge (sexe masculin) : 1957-1960 596

23. Taux de mortalité selon la profession et l'âge (sexe masculin) : dernière année disponible . 619

TABLES DE MORTALITE

24. Espérance de vie à un âge donné pour chaque sexe: 1940-1960 622

25. Quotients de mortalité à un âge donné pour chaque sexe: 1940-1960 642

26. Survivants à un âge donné pour chaque sexe: 1940-1960 658

NUPTIALITE

27. Mariages et taux bruts de nuptialité: 1952-1961. 676

28. Mariages selon l'âge de l'épouse et selon l'âge de l'époux: dernière année disponible 686

DIVORTIALITE

29. Divorces, nombres et taux bruts: 1952-1961 ... 696

TABLE CUMULATIVE DES MATIERES 702

Foreword

The 1961 *Demographic Yearbook* is the thirteenth in the series of compendia of demographic statistics issued by the Statistical Office since 1948, and the third to feature mortality statistics under the cyclical rotation plan of publication adopted for the *Yearbook,* by which a different topic of demographic statistics receives intensive treatment each year. The special topic of each of the 13 issues is set forth on page ii.

Official statistics from more than 200 countries and territories are able to be included through the generous cooperation of national statistical services. New tables presented for the first time include late foetal deaths and ratios by sex and by illegitimacy, time series of perinatal deaths and ratios, and death rates specific for marital status, age and sex. The current situation and time trends in mortality are further delineated by means of expectation of life, life-table mortality rates and survivors by age and sex for a 20-year span; time trends of general, infant, and foetal mortality covering the 15-year period 1945-1961; and distributions of deaths and death rates classified by combination of sex, age, marital status, cause of death, and occupation for the 6-years 1955-1960.

In addition to series on the featured subject, the volume also provides the usual statistics of area; density; population growth; world, continental and regional population figures and estimated birth and death rates; natality trends and distribution of births by age of mother; marriage trends and distribution by age of partners; and divorce trends.

The special text (Chapter I) consists of brief *Notes on Methods of Evaluating the Reliability of Mortality Statistics*; the *Technical Notes to the Statistical Tables* (Chapter II) describe the tables in terms of concepts, geographic coverage, and limitations of the data. The usual cumulative table of contents covers each of the 13 issues of the *Yearbook.*

Acknowledgement is made to the Population Branch of the Bureau of Social Affairs, United Nations Department of Economic and Social Affairs, for the classification of population estimates by method of construction, which appears regularly in Table 1, and for preparation of adjusted estimates of population for the world, continents and regions, shown in Table 2. The Population Branch has also prepared an analysis of mortality entitled "The Situation and Recent Trends of Mortality in the World," which utilizes many of the statistical series published in the *Demographic Yearbook.* This analysis will be published in the *Population Bulletin* No. 6.

*

* *

The *Demographic Yearbook* should be considered as one of a co-ordinated and interrelated set of periodic publications issued by the United Nations and the specialized agencies, designed to supply basic statistical data for demographers, economists, sociologists and public-health workers.

In particular, the general interest of the United Nations in the broad range of demographic statistics and that of the World Health Organization in those needed for the study of health problems, form the basis of the close co-operation of these agencies in the collection and publication of population, vital and other related types of statistical data. Under the co-ordinated plan, the United Nations *Demographic Yearbook* is the central international source of demographic statistics. Some of the data assembled for the *Demographic Yearbook* are reprinted in the publications of the World Health Organization—in particular in the *Annual Epidemiological and Vital Statistics*—to make them more readily accessible to the medical and public-health professions. In addition, the World Health Organization publishes annually compilations of deaths by cause, age and sex, detailed statistics on selected causes of death, information on cases and deaths from notifiable diseases and other data of medical interest, which supplement the *Demographic Yearbook* tables.

Considered together, these publications of the United Nations and the World Health Organization cover the major types of demographic and health statistics, and both sets should be used when detailed figures on the full range of internationally assembled statistics on these subjects are required.

Avant-propos

L'*Annuaire démographique* de 1961, qui est le treizième d'une série de recueils de statistiques démographiques que le Bureau de statistique fait paraître depuis 1948 est le troisième recueil qui présente surtout des statistiques de la mortalité, conformément au plan d'alternance des sujets spéciaux selon lequel un aspect particulier des statistiques démographiques fait chaque année l'objet d'une étude approfondie. La liste des sujets spéciaux traités dans les 13 recueils parus jusqu'ici est reproduite à la page ii.

Des données officielles provenant de plus de 200 pays et territoires ont pu être publiées grâce à la coopération généreuse des services statistiques nationaux. Les tableaux présentés pour la première fois contiennent notamment des statistiques des morts fœtales tardives selon le sexe avec indication des pourcentages d'illégitimité, des séries chronologiques (nombre et rapports) relatives à la mortalité périnatale ainsi que des taux de mortalité selon l'état matrimonial, l'âge et le sexe. La situation actuelle et l'évolution de la mortalité sont en outre décrites au moyen de tables de l'espérance de vie, de mortalité et de survie selon l'âge et le sexe pour une période de 20 ans, de tableaux retraçant le mouvement de la mortalité générale, infantile et fœtale pendant la période de 15 ans comprise entre 1945 et 1961 et de séries indiquant la répartition des décès (nombre et taux) selon le sexe, l'âge, l'état matrimonial, les causes de décès et la profession pour la période de 6 ans comprise entre 1955 et 1960.

Outre les séries concernant le sujet spécial, le recueil comprend les statistiques habituelles sur la superficie des pays et territoires, la densité de leur population et l'accroissement démographique; des statistiques sur la population du monde, des continents et des grandes régions géographiques; des taux estimatifs de natalité et de mortalité; des séries indiquant le mouvement de la natalité et la répartition des naissances selon l'âge de la mère, le mouvement de la nuptialité et la répartition des mariages selon l'âge des époux ainsi que le mouvement de la divortialité.

L'étude spéciale (chapitre I) est constituée de brèves *Notes sur les méthodes d'évaluation de la fiabilité des statistiques de la mortalité*; les *Notes Techniques sur les tableaux statistiques* (chapitre II) sont consacrées aux définitions, à la portée géographique et aux insuffisances des données figurant dans les tableaux. La table cumulative des matières habituelle couvre chacun des 13 recueils de l'*Annuaire*.

Le Bureau de statistique tient à remercier ici le Service de la population de la Direction des affaires sociales du Département des affaires économiques et sociales de l'ONU, qui a bien voulu se charger du classement des estimations de population selon la méthode d'établissement desdites estimations, classement qui est régulièrement donné dans le tableau 1, et de la répartition des estimations rectifiées pour le monde entier, les continents et les grandes régions géographiques du monde (tableau 2). Le Service de la population a également préparé une analyse de la mortalité intitulée "La situation et l'évolution récente de la mortalité dans le monde" qui repose sur un assez grand nombre des séries statistiques publiées dans l'*Annuaire démographique*. Cette analyse doit paraître dans le Bulletin démographique No 6.

*

* *

L'*Annuaire démographique* s'intègre dans l'ensemble de publications complémentaires que font paraître périodiquement l'Organisation des Nations Unies et les institutions spécialisées pour fournir des statistiques de base aux démographes, aux économistes, aux sociologues et aux spécialistes de l'hygiène publique.

En particulier, l'intérêt que l'Organisation des Nations Unies porte au vaste domaine de la démographie générale et celui de l'Organisation mondiale de la santé à l'égard des statistiques indispensables pour l'étude des problèmes sanitaires forment la base d'une coopération étroite entre ces deux organisations qui rassemblent et publient de concert des données sur la population, des statistiques de l'état civil et d'autres séries connexes. Conformément au plan de coordination, l'*Annuaire démographique* de l'Organisation des Nations Unies occupe une position centrale dans l'ensemble des recueils internationaux de statistiques démographiques. Les publications de l'Organisation mondiale de la santé, en particulier celles de la série intitulée *Statistiques épidémiologiques et démographiques annuelles,* reproduisent certaines des données rassemblées dans l'*Annuaire démographique* afin de les rendre plus accessibles au corps médical et aux agents de la santé publique. En outre, l'Organisation mondiale de la santé publie chaque année des statistiques sur les décès selon la cause, l'âge et le sexe; des séries détaillées sur les décès imputables à certaines causes; des données sur les cas de maladies à déclaration obligatoire et sur les décès dus à ces maladies ainsi que d'autres statistiques présentant un intérêt de point de vue médical, qui, toutes, viennent compléter les tableaux de l'*Annuaire démographique*.

Ensemble, ces publications de l'Organisation des Nations Unies et de l'Organisation mondiale de la santé contiennent toutes les catégories principales de statistiques démographiques et sanitaires; il convient de les consulter concurremment si l'on veut connaître dans tout leur détail les statistiques rassemblées à ce sujet sur le plan international.

NOTE ON GEOGRAPHIC AREAS

The form of presentation in this *Yearbook* does not imply official endorsement or acceptance by the United Nations of the status or boundaries of the territories as listed or described. It was adopted solely for the purpose of providing a convenient geographic basis for the accompanying statistical series. The same qualification applies to all notes and explanations concerning the geographic units for which data are presented.

NOTE SUR LES UNITES GEOGRAPHIQUES

Il ne faudrait pas conclure de la présentation adoptée dans cet *Annuaire* que les Nations Unies approuvent ou reconnaissent officiellement le statut ou les limites des territoires mentionnés. Ce mode de présentation n'a d'autre objet que de donner un cadre géographique aux séries statistiques publiées. La même réserve vaut également pour toutes les notes et explications relatives aux pays et territoires qui figurent dans les tableaux.

CHAPTER I. NOTES ON METHODS OF EVALUATING THE RELIABILITY OF CONVENTIONAL MORTALITY STATISTICS

I. INTRODUCTION

The role of mortality statistics in planning and executing public health programmes, and their even wider role in the analysis and projection of population trends required for policy making and planning in many economic and social fields, emphasizes the need for reliability in these measures. Since recognition of the need for reliability is the first step in its attainment, it may be useful to review the potential sources of error in mortality statistics together with some of the accepted methods which can be used to measure the effect of these errors. Remarks will apply to general and infant mortality statistics only; evaluation of foetal mortality statistics cannot be achieved by the methods suggested below.

Conventional mortality statistics are registration statistics. This means that they are compiled from observations recorded by a registrar from information given by an informant. In other words, this method of data collection is accomplished by an interview, carried out in a central place by a resident registrar questioning a mobile informant; this may be contrasted with the technique of an interviewer or enumerator recording information in the informant's home, a method commonly known as the enumerator-, census- or survey-method. Despite the basic difference in technique, mortality statistics are subject to the same basic sources of error as are common also to enumeration statistics; these are errors of quantitative accuracy or coverage and qualitative errors in reporting of items of information. Quantitative errors will be discussed first.

II. MEASURING QUANTITATIVE ACCURACY OF MORTALITY STATISTICS

Errors in the quantitative accuracy or completeness of coverage of traditional mortality statistics are, for all practical purposes, errors of underregistration. One may say almost categorically that the chances of inflation or overregistration occurring in connexion with death statistics is almost zero. Duplicate registration is theoretically possible but, in fact, very unlikely, except from an international viewpoint in the sense that a death may be registered in the country of death and again in the country of usual residence. The potential number of these duplicates is, however, so small in relation to the universe that this source of error may safely be disregarded.

Errors of omission are, however, the real problem. Underregistration of deaths is brought about primarily by failure of the informant to report or give evidence of the death to the registrar. Since registration, except in so far as inheritance is concerned, confers no benefit on the informant, and since, in many situations, it may in fact be detrimental to the economic situation in that certain benefits are thereby withdrawn, the informant may tend to neglect the formality of death registration if at all possible. This may be true in connexion with deaths at all ages, but it is particularly obvious in regard to infant deaths. Registration of deaths of infants who die during the first few days of life is often overlooked, just as the young children tend to be omitted from the census of population. This omission is naturally more prevalent in rural areas where unconventional disposal of the body may be accomplished more easily than in urban areas. Likewise, it is more prevalent in less highly organized societies where public administration authorities are not so effectively deployed.

Responsibility for failure to register a death may rightfully be shared by the registrar. Under the law, a registrar has the responsibility of making himself aware of all the vital events, the occurrence of which he must record. He is empowered to take such steps as are required to attain the objective of complete registration. However, the status of registrars in public administration is usually such that he is either not competent to initiate steps which would improve the completeness of registration, or he is too much concerned with other affairs to make the necessary efforts. Moreover, it is often true that through poor public administration, the civil-registration office is not conveniently placed in relation to potential informants, a situation which is likely to be a factor in underregistration.

Detection of underregistration in death records, and assessment of the extent of omissions or conversely the completeness of registration, may be accomplished in two ways which, for convenience, may be designated as the direct and the indirect methods. The direct method is the more fundamental one which consists of checking the individual entries on the death register against corresponding records of death from an independent source to discover omissions. This is analogous to a post-censal field check of the population census whereby a set of independ-

ent records are produced in such a way as to be more accurate than the originals and which, therefore, produce additions to the enumerated population. The indirect method of detecting and possibly assessing the extent of omissions is the analytical procedure which consists in scrutinizing the statistical results tabulated from the records in the register, for plausibility, comparing these with corresponding numerical data from another time period or from a similar geographical area, for consistency, examining distributions for internal consistency and for conformity to classic relationships which are known to exist between different mortality characteristics from the same universe, or between these and a theoretical model. Both the direct and the indirect method should be employed in the evaluation of mortality statistics if at all possible; in fact, the indirect evaluation should be part of almost any analysis which may be undertaken. Because it gives the first rough evaluation of accuracy, the indirect methods which are dependent on scrutiny of tabulated data and relative numbers are considered first.

EXAMINATION OF STATISTICS (INDIRECT METHOD)

An indication that mortality statistics may be unreliable can be had from an examination of the tabulated results with a view to ascertaining how closely they conform to pre-determined norms, established through demographic analysis of statistics considered complete and reliable. Examination of the size of frequencies and of the level of the mortality rates for plausibility will provide first guides; the internal consistency of distributions or lack of it will be useful; the comparison of the patterns displayed by frequencies and rates with expected configurations can be revealing.

Consistency of totals: The simplest approach consists of comparing the tabulated total frequencies derived from the current death register with corresponding data from a recent previous year. For example, the total number of deaths reported for a year (or some part thereof) should be roughly of the same order of magnitude as the number reported for the previous year (or period) barring epidemics or other catastrophes which contributed to excessive mortality, and large migrations of population which would tend to increase or decrease the incidence of death. This type of analysis is particularly pertinent to data for small geographic areas.

The relationship between the number of deaths and births reported for the same area and time period may also provide a valuable clue. This ratio varies rather widely between countries, but within one country it should be comparatively stable spatially and over time. Hence, a steady index may be indicative of reliability.

On a slightly more complex level, the accuracy of the aggregate number of deaths reported during intercensal years may be evaluated by utilizing the results of two successive censuses of population to estimate mortality. This technique, which is known as the "balancing equation method", makes use of the fact that the number of persons reported above a selected age at a recent census were alive at the previous census and, at that time, younger by the number of years in the intercensal period. Since enumeration at young ages is often deficient, and since it is desirable to eliminate the potential error of the birth component, it is preferable to work with the population initially aged 5 years and over. The intercensal decrease in the chosen population cohort should be the number of deaths which occurred in this age group over the period, minus the immigrants of those ages received plus the emigrants lost. If there is a substantial discrepancy between the enumerated decrease and the decrease accounted for by deaths and migration, further investigation is indicated. It would be necessary, for example, to obtain information concerning the completeness of enumeration of the two censuses and of the accuracy of migration statistics but even in the absence of proof of census completeness it is probable that most of the error can be attributed to deficient death registration.[1]

Consistency of age-sex patterns: The degree of internal consistency displayed by distributions of mortality statistics is also a useful point of departure in assessing reliability. For example, when a population consists of more or less equal numbers of males and females, and provided no extraneous disturbing elements such as a war intervenes, the total of male deaths should slightly outnumber female deaths. The exact level of the sex ratio for deaths of all ages depends on a variety of factors, but one might at least expect rather similar gross indices for the various geographic subdivisions of a country. Marked deviations over time or between areas would indicate the need for investigation of the completeness with which deaths or births were being registered.

Age differentials in the sex ratio at death should also be examined. As a general rule, more males than females die in infancy, childhood and adolescence. For the duration of the child-bearing age, female deaths may outnumber male deaths, but at older ages they consistently do so. Marked geographic variations in this mortality pattern, sharp fluctuations of any of the age-specific sex ratios over time, or abrupt changes in level between ratios for different age groups, would probably be indicative of irregularities in registration or in age reporting.[2]

With special reference to infant deaths, it may be noted that where infant mortality is high, the sex ratio is usually in the range of 110-120 male deaths per 100 female deaths. Masculinity ratios in the order of 130-140 per 100 often accompany low infant mortality rates. Sharp fluctuations or consistent variations from these patterns may be viewed as indicative of possible omissions in infant death registration.

Since it is suspected that deficiencies in death registration may perhaps be greater in respect of infants than of persons at older ages, a study of the ratio of infant deaths to total deaths may produce useful results. The proportion that infant deaths form of deaths at all ages is relatively stable for any one area. Between countries with low mortality and fertility and those with high mortality and fertility, the ratio may vary between 15 and 30 per cent, but it should not vary greatly from area to area within a country, nor should it evidence sharp fluctuations over

---

[1] For additional details and examples of the application of the method, see *Methods of Appraisal of Quality of Basic Data for Population Estimates.* Manual II. ST/SOA/Ser.A/23. (United Nations Publication, Sales No.: 1956.XIII.2.) pp. 27-29. Also see *Methods of Using Census Statistics for the Calculation of Life Tables and other Demographic Measures.* ST/SOA/Ser.A/7. (United Nations Publication, Sales No.: 1950.XIII.3.) pp. 2-3.

[2] See also page 6.

time within one country's experience. Lack of stability in the ratio may be indicative that death registration is especially defective among infants.

Examination of a distribution of infant deaths by month of age also can provide an indication of which deaths may be being omitted from the registers. It is known that infant mortality is highest during the first few days of life and that in most countries it declines smoothly and continuously in the succeeding weeks and months. Since the distribution of deaths over the first year of life follows a consistent pattern over time, though at varying levels, marked divergence from the pattern may be indicative that deaths at some age groups tend not to be registered as completely as they should be. These aberrations will be evident in the absolute numbers; they do not depend on rates as do age-specific death rates.

Credibility of rates: The relationships of frequencies which might indicate underregistration of death have been outlined above. When these absolute numbers are divided by the corresponding population groups, other meaningful indicators of apparent deficiencies in registration completeness may emerge. The first of these indicators is the level of the crude general death rate.

Crude death rates based on accurate statistics are rarely lower than about 8 deaths per thousand, unless the population concerned has an atypical age distribution. For example, the crude death rate among the Jewish population of Israel was 5.5 per 1 000 in 1959, while rates in other economically comparable countries, where registration was considered complete, ranged much higher. However, the Jewish population of Israel is heavily concentrated at the younger ages where mortality is light; therefore, since the crude rate is a weighted average of age-specific rates, it is lower than it would be among an equally healthy but older population. If very low crude death rates persist in a population whose age distribution is not abnormal, there is an indicated need to explore the possibility of deaths having been omitted or of the population base being unreliable.

Other things being equal, the range of the crude death rate for geographic sub-divisions of a country or territory should not be wide. This being so, examination of the pattern of geographical variation in the rates should reveal sub-national areas in which excessive underregistration of deaths might be suspected. This assessment of credibility should naturally include a parallel examination of the reliability of the population component of the rates. The aim should be an evaluation of the stability of the geographic pattern over time, and the implications in terms of the probable reliability of the national average.

A second relationship may also have relevance. Low death rates are normally found only in association with low birth rates. A recorded death rate of 10-15 per 1 000 is normally found in association with a death rate of 15-25 per 1 000. If the death rate which accompanies a low birth rate is either extremely low or abnormally high, the accuracy of the basic mortality statistics may be suspect. In a study of the pattern of geographical variation of rates within a country, correlation of low death rates and low birth rates is a danger signal.

Differentials in death rates specific for marital status also provide a pattern against which observed rates may be evaluated. Death rates among married persons are usually lower than those for the single, widowed and divorced. This is true for both males and females and for all ages. Deviations from this pattern are indicative of need for further analysis concerning the numerator or the denominator of the rates.

The patterns of mortality rates specific for age and sex afford perhaps the best clues to possible deficiencies. In the first place, age specific death rates for males are generally higher than those for females throughout the entire age span unless there is an excess of maternal mortality in the population or a fatal disease which is sex specific. Secondly, among the various age groups, mortality is invariably very much higher under one year of age than it is at any other age throughout the life span. From the high point achieved at infancy, mortality rates decrease smoothly to a low point at ages 10-14, after which they again rise smoothly, continuously but rapidly, creating a U-shaped curve. Deviations from the pattern of excess male mortality, or rates at variance with the U-shaped curve, indicate the need for special explanations, in terms of population risk, cause of death, or underregistration.

The shape of the infant mortality rate curve by age reflects the same pattern as is evidenced by the absolute numbers, because each rate by age is computed against the same total of live births and is, therefore, a ratio rather than a rate in the probability sense. As noted above, mortality is usually highest at the youngest infant age; thereafter, it decreases smoothly. Deviations from this half U-shaped pattern may indicate underregistration of death or inaccurate infant age reporting.

The absolute level of the infant mortality rate is not a useful index for indicating underregistration of infant deaths because it is affected also by the completeness of registration of the live births which constitute the denominator of the rate. However, in general terms, the level of the infant mortality rate should be consistent with the level of the age-specific rates and their weighted average, the crude death rate. Using this relationship, the Population Branch of the United Nations, Bureau of Social Affairs, has synthesized the age variations in life-table mortality among 50 countries for the period 1900-1950 into a set of model life tables.[3] This series of 40 life tables in transition from high to low levels of mortality cover at equal intervals the entire range of mortality encountered in the world and they describe the average relationship between mortality in various age-sex groups for a group of countries at different mortality levels. When the life-table mortality rates observed for a specified country are compared with those of the model which it most closely matches in respect of the infant mortality or childhood mortality rate, variations indicate potential inaccuracy in the observed data. In other words, the model life tables may be used to test the accuracy of existing sex and age-specific mortality rates.

The model tables have been used for this purpose *inter alia* in respect of Costa Rica, El Salvador and Guatemala, using the 1950 life-table mortality rates for infants to enter the model tables. Thus, the 1950 life-table infant mortality for Costa Rica, both sexes, was compared with the average value of Model Life Tables 16 and 17; El Salvador was compared to Model Tables 15 and 16 and Guatemala with Model Tables 17 and 18. The results of

[3] *Age and Sex Patterns of Mortality: Model Life-Tables for Under-Developed Countries.* ST/SOA/Ser.A/22. (United Nations Publication, Sales No.: 1955.XIII.9.).

the comparisons show that in the case of Costa Rica, the differences above age 5 are as small as could be expected. However, mortality at age 1-4 appears too large in comparison with infant mortality, a relationship which may be due to underregistration of infant death, overstatement of births or inflation of the mortality rate at age 1-4, due perhaps to omissions in the census at those ages.

For Guatemala and El Salvador, discrepancies are of a systematic type which could indicate that the infant mortality rates shown in the life tables are entirely too low in comparison with mortality at other ages. Such anomalies suggest the need for further investigation.

COMPARISON WITH OTHER RECORDS (DIRECT METHOD)

The various indirect or analytical procedures for obtaining clues to possible underregistration of deaths result in knowledge that discrepancies exist between the expected and the observed. The objective of the direct method of assessment of omissions is to identify the cases of death which failed to get registered and to obtain a measure of their number. This is the method of evaluation which gives guidance for remedial action. Knowledge of deficiency and its extent can be gained from indirect checking, but the indirect methods cannot identify the missing events and, theoretically, correct the registers. Nor can they identify the particular geographic areas or population groups in which underregistration of death is more prevalent.

The first requirement for the direct method of checking is a second list of deaths. By definition, no secondary source of information on deaths should include more entries than the official death register but, depending on the nature of the list, each may include different entries. Any relatively comprehensive list of deaths developed for a purpose other than death registration can profitably be employed to check the official register and the most obvious are the records of interment in cemeteries.

Cemetery lists: For legal and sanitary reasons primarily, but also incidentally for assuring the comprehensive nature of the death registers, most countries provide that issuance of a permit for disposal of a dead body is dependent upon the prior registration of the death in the official register and the obtaining of a death certificate. This provision is rooted in the obligation and right of the State to determine the fact and the cause of death in terms of whether it was due to natural causes or to some criminal occurrence which might call for police action in line with protection of the rights of its citizens. Hence, such a provision should ensure that all deaths, criminal and natural, would be recorded. However, it appears that in some parts of the world this provision is not always complied with. It is known that in the case of young infants, especially infants dying in rural areas, organized cemeteries are not always used for burial, and even arrangements for burial of adults is sometimes made with a religious or private organization rather than with civil authorities. Therefore, cemetery or other burial lists do provide the most accessible register of deaths for checking purposes, especially in urban areas, and the number and identity of entries in the cemetery records which do not appear on the death register should constitute one indication of the incompleteness of the latter.

Notification registers: A second list of deaths which is obviously not comprehensive but may be independent is the notification register. Many countries arrange for the physician who attended a deceased person or examined the body, or the administration of the hospital in which a death occurred, to notify the registrar of each such occurrence. This obligation is often limited to deaths from infectious diseases and it is additional to the obligation of the physician to certify to the cause of death by means of the medical certificate (see page 8). Thus, the attendant's notification constitutes a secondary list of deaths, and matching of the death register entries to this can be used to reveal events which failed to be legally registered. Such a measure of omissions, like that derived from cemetery lists, constitutes only an indication, not an over-all evaluation. It is a technique which provides for improving completeness and as such it is usually carried out routinely wherever the two sets of records exist. Since notification is also obligatory, deaths registered and not notified may also be used as an indicator of the adequacy of the physician's compliance.

Demographic survey records: Both the cemetery lists and the doctor's notification are administrative lists, related to the death register in one way or another. A list of deaths completely independent of the official death register can be established by the technique of the household interview. Such a retrospective canvass of households may be designed to cover the whole population resident in a country, those in a selected administrative subdivision or representative sample of the area or population. The technique is to enquire of each household in a particular area whether a death had occurred therein during a selected time period, and to collect information regarding the characteristics of the decedent which would allow him to be identified with an entry in the death register. The resultant list of deaths is then matched, person for person, to the entries on the death register.

The retrospective survey provides for death statistics the same sort of checking device as is provided by a post-censal field check of population enumeration. In both cases, the matching of the two independent sets of records, results in four categories of "matches": (1) there will be a number of deaths which are recorded on both lists; (2) there will be deaths recorded on the death register but omitted from the survey list; (3) there will be deaths recorded on the survey list but omitted from the death register; and (4) there will be a hypothetical group of deaths which escaped being listed either on the register or the survey. For practical purposes, it is assumed that the fourth group will be very small and that the third group constitutes a good approximation of the omissions from the death register. It is an analysis of this group which will provide an evaluation of the degree of underregistration and also an indication of where and what type of remedial action is indicated. Analysis of the second group, that is, the registered deaths which were not reported on the survey, provides some measure of the accuracy of the survey method of data collection.

Despite its apparent simplicity, the survey method of generating an independent list of deaths for matching to the death register is subject to many sources of error. The overriding disadvantages are those of any household survey, namely dependence (1) on the willingness of the informant to give information, (2) on his knowledge of the

events, and (3) on his ability to remember well enough to place the event correctly in time and space.

Willingness to divulge information is especially important in connexion with death surveys. There has long been a feeling that, even in modern societies, there is a reluctance to mention or discuss a death which had occurred in the household and hence there would be considerable deliberate under-reporting. Indications from small-scale experimental enquiries in industrialized countries have tended to disprove this thesis but it cannot be denied that in some more primitive societies there are likely to be strong superstitions which prevent the revealing of a death, especially of young and unnamed children. This is one of the reasons why the list of deaths generated by a survey will often be only a partial list, as is evident from the low death rates estimated by this technique in countries where civil registration of death is not established. However, it is likely that reluctance to mention a death to an interviewer would be correlated with failure to register it with the proper authorities. Hence, this particular disadvantage of the survey method is probably more damaging to its use as a means of measuring mortality levels, where civil registration does not exist, than it is in connexion with checking completeness of the death registers. These unreported deaths would likely form part of the hypothetical "not reported/not registered" fourth group mentioned above which may constitute a larger proportion of the total than is generally assumed. Unfortunately, there is no perfectly reliable technique for estimating the size of this group.[4]

Even if the informant has no basic inhibitions about discussing a death, the success of the survey technique is dependent on his ability to remember the event and to place it correctly in time and space. It is probably true that memory lapse accounts for most of the omissions in survey results. One remedy might be to shorten the time period covered by the enquiry, but when an household survey of mortality is conducted on a sample basis, either the sample size has to be increased unduly or the period of enquiry prolonged in order to get an adequate number of deaths. Increase in the size of the sample increases cost; prolongation of the time period tends to increase memory lapse and decrease precision.

Failure to place the death correctly in time will not completely invalidate this technique for checking purposes. It will increase the difficulty of locating the event in the death register and, if the survey-reported deaths are used as a measure of mortality, it may also have the effect of inflating the rate for the incorrectly assigned time period. But failure of the survey to place the death correctly in space presents a more serious problem. In a mortality survey, the informant is asked to give information about deaths which occurred among residents of his household, while the civil register comprises records of deaths which occurred in the area, irrespective of residence. Failure to obtain information on the place where the survey-reported death occurred may result in nonproductive searching of the register and consequent understatement of registration completeness, because if the death occurred outside the jurisdiction of the register being examined, it would normally have been registered in another registration area. Similarly, failure to find a matching survey-reported death for each death on the register may be due to the fact that the decedent was a non-resident or a prior resident of the area. Either result will to some extent impair the utility of the name-matching technique to measure the quantitative completeness of coverage of the death register.

A more important disadvantage of the household survey technique in measuring completeness or assessing mortality levels is that often the occurrence of the death of an individual eliminates the single-person household which he constituted and there remains no one who has knowledge and can report on the fact of that particular death. A survey of households would not, therefore, be able to indicate that such a death occurred; if it were not registered either, there would be no way of learning about it.

III. MEASURING QUALITATIVE ACCURACY OF TOPICS

The preceding sections of these notes have been concerned with methods of detecting and, to some extent, evaluating the degree of underregistration, deficient coverage, or omissions in mortality statistics. One-to-one matching of death records with death reports independently assembled has been described as the direct method of identifying the missing events and counting them, while aberrations in mortality statistics have been set forth as indirect indicators of potentially defective registration.

The paragraphs which follow are concerned with the other aspect of evaluating mortality statistics, that is, the measurement of the qualitative accuracy of the statistics which describe the characteristics or personal particulars of the decedent. Review of the potential errors which may be involved in reporting, recording, and processing the information regarding the death, and a search for their origin, reveals that they are primarily "response errors", due usually to one or more of the following factors: (1) the informant did not have knowledge of the information required concerning the deceased person; (2) the informant or registrar did not understand and/or follow the recording instructions carefully; (3) the informant refused to answer a question; (4) the registrar failed to put the question to the informant. A fifth possibility is that the statistical processing was not uniformly done.

The effect of these response errors is to distort or make unreliable the distribution of mortality statistics according to the characteristics involved and this poses one of the most important problems in using the statistics in demographic analysis. But, it should be noted that the distribution of deaths by selected characteristics may be equally distorted by underregistration. If the basic omissions are not distributed evenly throughout the area and among the population, but are more prevalent in certain geographic regions or among decedents of one sex, se-

[4] For more detailed information on this method, see Manual II: *Methods of Appraisal of Quality of Basic Data for Population Estimates, op. cit.*, pp. 29-30.

lected ages or a certain marital status, the effect is one of distortion in respect of the characteristic affected equal to that which results from the response errors mentioned above and described below.

Mortality characteristics requiring evaluation for quality of reporting are all those connected with the fact of death or the deceased person, including sex, age, parental age (for infants), marital status, duration of marriage, cause of death, place of residence, place of death, date of death, occupation, and industry. Methods for verifying all of these have not been devised but for a few, certain techniques suggest themselves. Each of these characteristics will be discussed in terms of indirect methods of evaluation, which rely on statistical manipulations of tabulated results, and direct methods involving the matching of individual records.

Matching of a death record to a previously established record presumed to carry accurate information on one or more of the topics under discussion appears to be a very useful device. It must be emphasized, however, that in a mobile population, it is often very difficult to find the matching record. For example, the studies mentioned on page 7 which were designed to measure the differences in the reporting of occupation and other items (1) on the schedules of the 1950 population census and the birth and death certificates of the vital records system in the United States, and (2) on the 1951 census schedules and death certificates in the United Kingdom, depended on identifying persons in a sample of individuals in the civil registers with persons in the census schedules. In the United States experience, the decedent could be found in the census schedules for only about 79 per cent of the cases in the death sample. In the United Kingdom study, a corresponding figure is not available but other evidence points to the likelihood that it was below 87 per cent. However, the United States study also concluded that failure to match did not introduce any substantial bias into the relationships revealed. Therefore, for qualitative evaluation this method may yet yield reliable results.

SEX

Misstatement of the sex of a deceased person is probably very rare; should it occur, it can often be rectified by reference to other personal particulars on the report of death such as name and occupation. Because of the unlikelihood of error, one may assume that this characteristic is usually accurately reported and statistics based on it are reliable. Therefore, if the ratios of male to female deaths are out of line with the expected patterns, the cause may safely be assigned to sex differences in registration completeness, rather than to misstatement of sex.

AGE

Examination of statistics: The simplest and crudest way to detect inaccuracy of age reports is to examine the percentage distribution of deaths by age with a view to seeing what proportion are deaths for which age is not stated. A high proportion of deaths with unknown age would make the accuracy of every other age group suspect. Steps would then need to be taken either to prove that the deaths at unknown age were neither numerous enough or selected enough to bias the over-all distribution or to find out what the correct age should be in each case.

The possibility of errors in age reporting will have been detected and localized also by the examination of the configuration of deaths by age and sex and the pattern of the age-sex specific death rates, as described on page 3. Deviations from the expected age-sex patterns of mortality might have their origin in underregistration, but the possibility of inaccurate age reporting should not be overlooked. In particular, the likelihood of digit preference in age reporting should be investigated. The same tests as are applied to evaluate digit preference in distributions of population by age can also be applied to the age distribution of deaths. These are set forth in detail in *Methods of Appraisal of Quality of Basic Data for Population Estimates.*[5]

Another indirect method of detecting the possibility of error in the age characteristic of mortality utilizes the technique of the balancing equation, that is, population reported in sequential age cohorts from two successive censuses of population are compared. If the number of persons in a given age cohort at the earlier census exceeds the number currently present in the next older cohort by an amount much larger than the number of deaths recorded in the interim, any one of five causes could be sought: (1) there could have been a sizable emigration; (2) either or both of the two censuses could have been inaccurate in coverage; (3) age could have been misstated at the census; (4) deaths could be incompletely registered; and (5) age at death could be in error. Each of these possible explanations must be explored before inaccuracy in the age of decedents is confirmed.

Comparison with other records: The only precise way to verify the accuracy of the reported age at death is to match the death record to an independently completed record which contains the date of birth of the decedent or his age in completed years at some selected moment in time. Among such independent records, the most accurate for the purpose would be the corresponding birth record. Obviously, except in countries which maintain a reliable continuous register of resident population, such matching implies knowledge of where the deceased person was born and a search in the relevant birth register—all of which would constitute a very costly and laborious process in a mobile population and one not justified on a hundred per cent and repetitive basis for adult deaths. However, such a project could be undertaken on a sample basis to obtain a more exact idea of the quality of age reporting.

For infant and maternal deaths, this type of verification could be and is done routinely. In most cases, the required birth register is located in the same registration office as the death register and a cross-check is usually done in any case to confirm that the birth was registered. At this same time, the characteristics of the decedent can be verified. It may be pointed out that the verification of the age report for infant decedents is perhaps more important than it is for adults. Adult deaths are usually tabulated in age groups comprising five or ten years. Hence, since misstatements of age have a tendency to concentrate on ages ending in zero and five, the effect is masked by compensation. At ages under one year, however, errors tend to be caused by the failure to calculate age in units of hours, days, weeks and months, using the exact day, month and year

[5] *Op. cit.*, pp. 40-49.

of birth and the day, month and year of death. Infants who are less than 24 hours of age may be reported as 1 day; infants almost one year of age may be reported as age one. Moreover, an infant who lived only a few hours or even several days, may be registered as a stillbirth rather than a live birth and a death, thus depleting the frequencies at the early part of the infant age span. Because of these factors, it is especially important to match infant death records to the corresponding birth record to confirm the exact age at death. The age of the mother may also be verified at the same time.

The technique of comparing the report of age given on a death certificate with that shown for the decedent on the previous census schedule can be used to evaluate age reporting accuracy in mortality statistics. The difference in time reference between the date of enumeration and the date of death would have to be taken into account, but since many census schedules call for date of birth rather than age, this difficulty might be minimized in so far as age is concerned. The problem of locating the correct census schedule if the decedent had changed his place of residence, as defined for the census, between enumeration and death would probably present the greatest difficulty in connexion with time reference.

Such a study might be carried out for all death certificates, but it is more likely that a sample would suffice to yield the evaluation indices required. An example of the utilization of this technique may be found in the United Kingdom's analysis of the accuracy of statements of age in the 1951 census of population, the methodology and results of which are published in the *General Report*.[6] In that study an attempt was made to match selected information of which one topic was age for each of 9 864 deaths registered between 1 and 7 May 1951 to that on schedules from the 1 April 1951 census. The results showed that age statements at death registration had a high order of reliability. The United States study designed primarily to evaluate the comparability of reports on occupation from vital records and the 1950 census[7] also compared information on age and found that despite the difficulty of identifying all the persons involved in the sample, the method appeared to yield useful results.

Since it is likely that insurance records by virtue of their purpose would contain an accurate statement of age or date of birth, and since proof of death is required to initiate the issuance of insurance benefits, it would seem that records of social insurance could easily be utilized to verify the accuracy of age reported in the death register. The comparison might be limited to a sample of deaths covered by the social security system, but it is more likely that an arrangement providing for automatic routine verification would be easier to organize and maintain.

Another independent record against which age at death could be checked would be the records of death collected by a household interview survey such as that mentioned above for evaluating completeness of registration. However, the use of such records for a quality check is justified only if the age information from the survey could be presumed to be more reliable than that on the death register. It is conceivable that very experienced canvassers conducting intensive interviews might produce more accurate age reports than an informant responding to queries of the registrar, but it is debatable. Responses at the survey would be subject to all the various types of error inherent in data gathering by the interview method, set forth on page 4.

MARITAL STATUS

Examination of statistics: As in the case of the age distributions of deaths, a large proportion of the deaths tabulated in the unknown marital status category is indicative of potential lack of quality in the statistics based on this attribute. In such cases, the possibility that registration procedures may be at fault should not be overlooked. Evidence is available, for example, to support the thesis that deaths of unknown marital status are primarily deaths of single persons at younger ages to whom the question was not put. The distribution by age should be of some assistance in investigating this line of enquiry.

Comparison with other records: The accuracy of statements on marital status of the decedent can only be checked by comparing them to statements on other records, but this is theoretically difficult to do because of the fact that marital status can change so quickly. To match statements on death records to the previous population census entries, for example, would require corroborating information on date of marriage, date of death of spouse, or date of divorce, in order to make the necessary time adjustments. However, the United States and United Kingdom studies previously mentioned,[8] revealed high rates of identity in respect of this topic without correction having been made for differences in the time reference, on the assumption that the status of few decedents were likely to have changed in the interim. This result may indicate that verification by matching of death records to census returns is not impossible.

To match decedents to returns from a sample survey of mortality made immediately after the period of occurrence of the deaths would be more satisfactory because, at this time, the survey informant could give relatively reliable information. However, all the defects of the survey technique in producing accurate information retrospectively would be operative and the reliability of the data might be very suspect.

Perhaps the only useful steps that can be taken in so far as this topic is concerned is to ensure that the definitions and tabulation procedures employed in death registration, especially in so far as consensual marriages are concerned, are consistent with those used in obtaining the population which will serve as a base for rates.

ECONOMIC CHARACTERISTICS (OCCUPATION AND INDUSTRY)

These items, like marital status, can best be checked against other independent records and, like marital status, the production of an accurate set of records for matching purposes is difficult, due in part to the element of time

[6] *Census 1951, England and Wales; General Report.* General Register Office. London: Her Majesty's Stationery Office, 1958. pp. 41-43.

[7] *The Comparability of Reports on Occupation from Vital Records and the 1950 Census.* Vital Statistics—Special Reports, Vol. 53, No. 1, June 1961. U.S. Department of Health, Education and Welfare, Washington 25, D.C., pp. 22-24.

[8] *The Comparability of Reports on Occupation from Vital Records and the 1950 Census, op. cit.*, p. 24; and *Census 1951, England and Wales; General Report, op. cit.*, pp. 43-44.

involved. Over and above the specific difficulties is the general problem of identifying the persons involved.

Comparison with other records: The use of census schedules as the independent set of records for checking a sample from the death register has been described in the United States and United Kingdom studies mentioned above.[9] Both of these sought to measure the degree of consistency obtained between occupation reported at death and that reported at the census, in order to evaluate the validity of an analysis of occupational mortality based, in the United States, on rates computed by relating deaths, classified by usual occupation, to population classified by occupation at the time of the census. In view of the objectives, rather broad areas of agreement were accepted as indicating comparability but the technique could be adapted to more refined evaluation procedure as well.

Labour force sample-survey schedules could also be used as the second set of records for verification of economic activity information on the death register. The procedures would necessarily be the same as those employed with population census schedules but the difficulties might be eased because of the possibility of shortening the time interval.

Social security records as well as labour union files might yield verification data also. Because of their current nature, these more closely related records might be the most efficient and reliable source of occupation/industry information for assessing the accuracy of the death registers.

Follow-back survey: The United States study cited above indicated that lack of agreement found between reports of occupation on the census schedule and those on the death register appeared to be due to response variation. If this is so, the method of the follow-back survey, described in connexion with cause of death on page 10, might also yield useful results in evaluating the accuracy of economic characteristics reported on the death register. This technique consists of selecting a sample of death certificates and, by going back to the households involved, obtaining a more precise and detailed history of economic activity for the decedent. Intensive study of such work histories would provide a means of evaluating the reports of occupation and industry recorded at the time of death, according to uniform standards. For a household canvass, the method requires a corp of interviewers trained in the special subject of the enquiry and it would, therefore, be possible only on a sample basis. However, the possibility of employing a mail survey in some areas might be explored.

CAUSE OF DEATH

Cause of death is the only item on the death report, the form of reporting of which has been prescribed by international agreement. The International Form of Medical Certificate of Cause of Death[10] prescribes the medical items of information which must be collected regarding each cause of death and the order in which the information is to be inscribed. The rules for its use are also highly standardized.[11]

This standardization of cause-of-death reporting is based on the premise that the physician who attended a deceased person is usually responsible for completing the medical certificate of cause, because he is in the best position to give a considered opinion about the morbid conditions leading to death and about their relationship to one another. If the deceased was not attended by a physician during his last illness, responsibility devolves upon a lay person, upon the public health official who makes a post-mortem examination of the history of the case, on the medical person who does an autopsy, or, if the identity of the deceased is not known or the death appeared to involve violence, upon a medico-legal authority, the so-called "medical examiner" who must certify the cause. Permits to dispose of the body by burial or cremation are issued only after the cause of death is certified in such a way as to leave no doubt as to it being due to natural causes rather than to violence.

In many countries of the world where both attending physicians and medical examiners are few, the great majority of causes of death are reported by lay persons.[12] These lay reports are obviously of lesser quality as statements of cause of death or medical diagnoses but there is no method of verifying their relative accuracy. Because of this, some countries base their mortality-by-cause statistics on medically certified cases only, while others assign most if not all non-medically certified causes to the "ill-defined and unknown" category of the International Statistical Classification of Diseases, Injuries and Causes of Death. The causes reported by medical authorities, however, are susceptible of quality evaluation and the methods which may be used can be classified into two categories, namely, the indirect and the direct approaches.

Examination of statistics: Perhaps the first approach to an analytical evaluation of the accuracy of cause-of-death statistics is an examination of the proportionate mortality at each cause. If a large majority of the deaths appear in the unknown or ill-defined cause category (B45 of the Abbreviated List), it is safe to say the frequencies for known causes are understated to varying degrees. For simplicity, the United Nations Statistical Office has used 25 per cent as a rule-of-thumb to govern the annual publication of mortality by cause of death in the *Demographic Yearbook*. If a distribution of deaths by cause shows 25 per cent or more of the deaths classified B45 *(Senility, without mention of psychosis, unknown or ill-defined)* the data are not published except in the special "mortality volume" which appears once every 5 years.

Closely related to this index of quality, though requiring a more detailed tabulation of cause categories, is the proportion of deaths allocated to a disease group described as "unqualified" or "unspecified". Examples of these categories are *Bronchitis, unqualified* (501) and *Other myocardial degeneration* (422.2). All residual groups have a tendency to be the catch-all for vaguely defined causes; therefore, as a general rule, the more deaths classified as due to these grouped categories of indeterminate causes, the less accurate are the other cause statistics.

The annual total of deaths recorded for any one cause

[9] *The Comparability of Reports on Occupation from Vital Records and the 1950 Census, op. cit.*, p. 1 ff.; and *Census 1951, England and Wales; General Report, op. cit.*, pp. 50-56.

[11] *Ibid.*, pp. 357-371.

[12] See Table 17, beginning p. 398.

or group of causes may also be used within limits as an indicator of deficiency in quality by comparing it to the previous frequency or proportionate mortality for the same cause. Barring the occurrence of certain catastrophes, causes of death are chronologically regular. If the numbers recorded for each cause are not consistent with past history and if there are sharp fluctuations not able to be attributed to a change in health or hygiene or to changes in the classification scheme, there is reason to suspect irregularities in reporting or processing. Effective changes in health or hygiene may be fairly easily identified as will changes in the classification which impair comparability between revisions. With this knowledge, other irregularities which persist in the data may be isolated and investigated further.

Another indicator of unreliability may be found in the distribution of deaths by cause, age and sex. If examination of the cross-tabulation reveals deaths of infants and young children assigned to suicide or homicide; if female deaths occur in categories limited to male diseases and *vice versa;* if children die from complications of pregnancy, or adult deaths are assigned to infections of the new-born,—in short, if an excessive number of implausible frequencies is revealed, the accuracy of the basic coding is suspect and the reliability of the data is put in question. In this connexion, however, it should be noted that some causes of death which on the surface appear to be restricted to certain age groups, as for example *Birth injuries . . .* (B42) *Congenital malformation* (B41), *Deliveries and complications of pregnancy . . .* (B46), are, in fact, used throughout the age span in some countries, so that the appearance of frequencies for the causes at the upper ages is not necessarily an indication of poor quality statistics.

Probably the most important indicator of the reliability of cause of death statistics, though one not so readily available, is the proportion of deaths from all causes stated to be medically certified. Such an indicator can be derived from a tabulation of deaths by cause and type of medical certification. The proportion of deaths certified as having been attended by a physician during the last illness should constitute the principal component of the index. A second group sometimes considered medically certified are those reported on a medical certificate of death, signed by a physician or "medical examiner" who examined the body after death; these are primarily medico-legal cases involving sudden natural or violent death but in some countries provision is made for all bodies to be so examined, irrespective of whether the case was attended or not. A third group are certifications based on the opinion of a physician who conducted a post-mortem investigation of the history of the case, but no inspection of the body. A fourth group may be those investigated post-mortem by para-medical personnel. The proportions of true "medically certified deaths", deaths certified by the attending physician, are not readily known. However, combinations of the various components mentioned above result in indices which vary from 100 per cent in Switzerland to 87 per cent in Venezuela to 30 per cent for Peru. In Venezuela, the 87 per cent is based on certificates *signed* by a physician of which about 30 per cent were without medical attendance. In the USA, some 25-30 per cent of all deaths are certified by post-mortem inspection of the body. The evaluation of the meaning of the index is a national problem but in essence, irrespective of definition, a high proportion of all causes certified by a physician would be indicative of relatively reliable statistics.

Comparison with other records: As in the case of other mortality characteristics, direct evaluation of the quality of cause-of-death statements on medical certificates of death is carried out by comparing the entries on the certificates with those from another source.

The accuracy of the cause-of-death statement for infectious diseases, for example, might be measured by matching the report of death to the notification of cases of infectious disease. This type of partial verification may also be applied in connexion with deaths from neoplasms, which is a reportable disease in some countries. Likewise, separate cancer registers may be used as an independent record source. Deaths from suicide and homicide could be checked to police records, but in many countries this would be superfluous inasmuch as the report of these deaths originates with the police department.

The proportion of death certificates carrying doubtful or obscure statements of cause might be used as an indicator of the basic precision of reporting. It is generally considered desirable to refer these records back to the reporting agent for clarification, but the ratio of unanswered queries and inadequately revised certificates to the total of all causes might be used as an index of reliability.

In some cases, lack of information on the part of the doctor is the reason for the obscurity, and rechecking his records could not confirm the adequacy of the reported cause. Evaluation in these cases must be based on comparison with independent records; these could be clinical reports in hospitals or the findings of operation, biopsy, laboratory examination or autopsy. The results of such checking, however, will almost invariably be two sets of information which are very different not only because one is based on more information than the other, but also because, even though they may agree on the cause of death, two doctors may record that cause on a certificate in different terms or in a way which will result in its being given a different code under the classification system.

The lack of correspondence between clinical diagnoses and autopsy findings, and between medical certificates of cause and autopsy or other findings, has been shown to be due in some cases to error, but it may also be caused in large part by the fact that many deaths are due not to one cause but to multiple causes, and all these secondary causes may not appear on all the records of death. Other operative factors are the changes in medical concepts, nosological viewpoints and diagnostic standards which influence a physician knowingly or unknowingly in the report of cause he enters on the certificate. Such attitudes will tend to make for differences in the causes drawn from the same evidence.

Another factor tending to produce differences between doctor's reports and clinical records or autopsy findings is the confidential nature of medical reports. The fundamental confidential nature of medical records between patient and physician is common to all countries but it varies in degree of stringency and its application to cause-of-death reporting. In a number of countries (primarily European), the cause of death is confidential information and measures for safeguarding this confidentiality are employed in channeling the report from the doctor to the

statistical service. In other countries where such measures are not employed, it may be assumed that a reported cause is not always the true cause, especially in cases relating to diseases with social stigma such as syphilis, alcoholism, mental disease and so forth. Hence, efforts to verify the accuracy of reported causes will be thwarted in countries where cause-of-death reports are anonymous and it will meet with little success in other areas because of the reluctance to publicize socially unacceptable diseases.

Follow-back survey: Another procedure for verifying the accuracy of both medical and lay reports of cause-of-death is the follow-back or retrospective investigation by interview to investigate the circumstances of a fatal illness in a sample of deaths. Such a study is being undertaken under the auspices of the Pan American Health Organization.[13] It is being organized in 10 cities of the Americas (because more urban than rural deaths are medically certified) and it is proposed to obtain a complete case history of each fatal illness and have the underlying cause of death systematically assigned by an expert. By this technique it is proposed to develop comparable mortality statistics for selected cities but the same technique could be used to evaluate the adequacy of the original statements of cause of death.

Causes of death certified by lay persons or para-medical personnel might be retrospectively investigated routinely by trained interviewers to obtain symptom histories. In most countries, the cost of such a procedure applied to all deaths would be prohibitive but it would be possible to select a sample of lay certified (uncertified) deaths for further investigation. The sample design would probably not involve a random selection but more likely a quota sample based on public health interests, and perhaps limited to urban areas. Such surveys would provide an evaluation of the correctness of the cause reported.

Evaluation of coding practice: Unreliability of cause-of-death statistics arises not only from lack of precision in the cause reported but also in the ways in which this cause is converted to a code for classification purposes.

Under the international recommendations,[14] the cause to be coded is the underlying cause, that is, the cause which initiated the train of morbid events leading to death. If more than one cause is involved, the International Certificate arranges for this cause to be entered in second place, after the direct or immediate cause. This is the cause to be coded. However, to take account of possible errors in entering the cause on the certificates, there are special rules and dispensations which are designed to assist the coder to select the proper cause for coding from certificates which appear to be inconsistent, equivocal or incomplete in this regard. The manner in which these rules are applied and the judgments made on the information given on the certificates results in the same cause being coded in various ways. This is particularly a problem where coding cause of death is done on a geographically decentralized basis.

The amount of divergence in coding practices can be evaluated by a test which involves having different groups of coders code the same set of death reports. One of the first such tests on an international basis took place in 1934 when a set of 1 073 certificates of death from "causes associated with pregnancy" which occurred in the United States during 1927 were sent to 24 other countries with a request that the cause shown be assigned to puerperal or non-puerperal causes as appropriate.[15] Sixteen countries replied to the request, revealing substantial disagreement in the assignments.

A similar investigation on a broader scale was carried out in preparation for the 1929 revision of the International List of Causes of Death when the US Bureau of Census in June 1935 at the request of the Commission for the Revision, submitted a set of 1 032 cases of death, each containing from two to five separate causes, to a number of countries for coding of the primary cause of death. The returns show that there was considerable difference in the Classification rules or principles followed by the various countries in 1935.[16]

No doubt other enquiries of the same type have been made in the interim but one, made in 1961, under the auspices of the World Health Organization Centre for Classification of Disease London, England, is of special interest[17]. This was a test of local interpretation of coding rules by arranging for the Canadian Dominion Bureau of Statistics, the United Kingdom General Register Office and the United States National Office of Vital Statistics, to code 3 random samples of 2 000 death certificates. Out of the 6 000 coding units, there were 390 where the coding was not unanimous. About one-half of these cases were the result of uncertainty as to which condition the certifier regarded as the underlying cause. The same technique can be applied on a national basis to detect and evaluate this source of error.

CHAPTER II. *TECHNICAL NOTES ON THE STATISTICAL TABLES*

INTRODUCTION

SOURCE OF DATA

The statistics presented in the *Demographic Yearbook* are official data unless otherwise indicated. They have been assembled by the Statistical Office of the United Nations from data transmitted monthly and annually by the national statistical services or other appropriate governmental offices of over 200 areas, supplemented when necessary by data from official publications.

To establish comparability in so far as computation procedures are concerned, all rates and ratios (except life-table functions and a few exceptions noted in the rate tables) have been computed in the Statistical Office of the United Nations according to the methods described for each table. The populations used for the computation of rates are census results or estimates, almost all of which have been published in this or previous issues of the *Yearbook*.

In cases where differences are observed between data in this volume and those published in previous *Demographic Yearbooks,* statistics in this issue may be assumed to be revisions received in the Statistical Office by 31 December 1961.

SCOPE OF DATA

Geographic coverage

In accordance with the original plans, the geographic coverage of the tables has been made as extensive as possible, within stated limits. This means that, in general, the *Yearbook* shows in each table national statistics for as many countries and territories as provide them. Moreover, in the absence of national coverage, data of more limited scope relating to registration areas and even to individual cities have also been included, wherever these statistics were deemed of sufficient utility and interest to warrant publication. It should be emphasized that publication of all available data does not indicate that a value judgment has been made as to their accuracy. Rather, the adoption of maximum geographic coverage is made possible because of the availability of quality codes, described on p. 15 and 16.

Table 1 is the most comprehensive, showing population and area for every country—sovereign and non-sovereign—having at least 50 inhabitants. This world-wide coverage makes possible the presentation in Table 2 of aggregates of population status and growth as well as crude birth and death rates for the world and 14 geographic regions. Time series of total population and vital statistics are next most comprehensive. Frequency distributions according to characteristics of the population are of more limited coverage and the geographic scope decreases as variables are introduced.

It should also be noted that rate tables are naturally somewhat more limited in geographic coverage than tables of absolute numbers. The criteria for rate computation are set forth in the table descriptions, beginning on p. 21.

Definition of territory (geographic area)

In so far as possible, both time series and frequency distributions are for the territory within the 1961 boundaries of the geographic unit specified. Whenever the territory to which data relate is other than present, footnotes have been used to describe the way in which the geographic composition of the reporting area differs from the area within 1961 boundaries.

In cases where the composition of present territory might require clarification, because of frequent or recent boundary changes or other reasons, a brief description of the salient points has been set forth in Table 1. It should be noted that notes describing territorial composition are confined to Table 1, except those explaining boundary or administrative changes which have occurred during 1961. To avoid the confusion which might result for the transition year, the current territory of these few areas is described in notes to all tables where they appear, even though the statistical coverage conforms to the present territory.

Definition of population

In assembling national statistics for publication, the basic aim has been to obtain data for the present-in-area or *de facto,* rather than for the habitually resident or *de jure* population. Thus, unless otherwise noted, population statistics and vital statistics include data for both nationals and aliens, native and foreign-born, aborigines, jungle tribes, nomadic peoples, displaced persons, internees, refugees and any other group present within the borders of a country or territory at a specified time.

It should be noted, however, that when the required statistics were available, population estimates have been adjusted or modified to include national armed forces and diplomats stationed outside the country, and to exclude alien armed forces, foreign diplomats and enemy prisoners of war stationed in the area. For clarity, such adjustments are explained in the tables both where the population figures are shown and, if necessary, where these figures are used in the computation of vital-statistics rates. For a more complete explanation of the adjustment, see p. 13.

NOMENCLATURE

Table 1—the most comprehensive in terms of geographic coverage and description—also serves as a guide to current official nomenclature or terminology, the country names used therein being the full official titles in use in the United Nations as of 31 December 1961.[1]

In other tables, however, it has been found convenient —because of space limitations—to use abbreviated or short titles for some areas. The shortened titles employed in Tables 3-32 are United Kingdom for the United Kingdom of Great Britain and Northern Ireland, United States for the United States of America, USSR, Byelorussian SSR and Ukrainian SSR for the Union of Soviet Socialist Republics, the Byelorussian Soviet Socialist Republic and the Ukrainian Soviet Socialist Republic, respectively.

Arrangement of names

The arrangement of the country names in the stub and box-heads of the tables is of two types:

Table 1 shows, for each continent and for the USSR separately (beginning with Africa and proceeding in English alphabetic order), all of the major geographic units of the world, classified according to broad administrative-status groups. Names shown first in each continent (without a category heading) represent sovereign states; these are followed by territories and dependencies, trust territories, areas under military government and condominiums, each group further classified by administering authority. All names within a category are arranged in English alphabetic order.

Tables 3-29, on the other hand, show only those geographic units for which statistics are available, and these names are arranged in straight English alphabetic order within continents. The name of the administering authority is not shown except in those cases where confusion might result because two territories have identical names.

Because of their number and importance, changes in names, administration and status which occurred during calendar 1961 are described in all the tables; for convenience, they are also set forth below in chronological order. Changes which occurred in 1960 and previous years have been described in previous issues of the *Demographic Yearbook.*

1961	*Former Name*	*Current Name*	*Nature of Change*
27 April	Sierra Leone	Sierra Leone	Independence
31 May	Union of South Africa	South Africa	Change of name
1 June	British Northern Cameroons	Integrated into Northern Region of Nigeria	Independence
29 September	United Arab Republic—Syrian Region	Syria	Independence
29 September	United Arab Republic—Egyptian Region	United Arab Republic	Name
1 October	British Southern Cameroons	Integrated into Republic of Cameroun	Independence
27 October	Mongolian People's Republic	Mongolia	Change of name
9 December	Tanganyika	Tanganyika	Independence

[1] For a majority of the areas, see: United Nations. Terminology Unit. *Names of Countries and Adjectives of Nationality.* Document ST/CS/SER.F/177/Rev. 1. 19 September 1961. 36 pp., mimeo.

It should be emphasized that the designations employed and the presentation of the material in this publication do not imply the expression of any opinion whatsoever on the part of the Secretariat of the United Nations concerning the legal status of any country or territory or of its authorities, or concerning the delimitation of its frontiers. They were adopted solely for the purpose of providing a convenient geographic basis for the accompanying statistical series. The same qualification applies to all notes and explanations concerning the geographic units for which data are presented.

EVALUATION OF QUALITY OF DATA

The attempt to differentiate demographic statistics according to their degree of accuracy, begun in the 1959 issue, has been continued in this *Demographic Yearbook.* Distinction is achieved through the use of two different type fonts—roman type for reliable data and italics for those of questionable reliability.

The basis of the dichotomous quality classification of the population series shown in Tables 1-5 was the code for estimates developed originally in 1950 and progressively modified since that time. Details of the theory and construction of the code, as well as the justification for its use in evaluation, are set forth on p. 15.

Vital statistics have been classified as reliable or unreliable according to the degree of completeness with which current vital events are believed to be registered. As in previous *Yearbooks,* complete vital statistics are judged to be those which represent at least 90 per cent of the total of births, deaths, marriages and divorces which actually occurred in a year. The series said to be complete or reliable have been set in roman type, while others of lesser or of unknown reliability are set in italics. The regular C and U code, which is the basis of classification, may be found as usual in the trend tables and the details of its formulation are given on p. 16.

To supplement and reinforce the rough classification described above, known variations in definitions and in methods of estimation and tabulation are, as usual, set forth in footnotes to each table. The implications of the qualifications, as well as sources of error and possible misinterpretation, are reviewed in the special text for each table beginning on p. 21.

Age-reporting errors in census returns were analysed, and censuses were classified according to reliability, for the first time in the 1952 *Demographic Yearbook.* This evaluation, which so far has been limited to censuses taken during the 1950 census period, appeared in each succeeding *Yearbook* through that for 1955 and it was re-printed in the 1960 issue; a condensed reference to it appears in this issue on page 15.

Another qualifying index, re-introduced in the 1953 *Yearbook,* has been continued. This is a dagger (†) used to distinguish those statistics which have been tabulated according to the year of registration of the vital event, rather than by the year of its occurrence. The importance of this qualification, especially in evaluating the quality of live birth statistics, cannot be overemphasized; a detailed exposition of its implications will be found on p. 17.

AREA

Statistics of territorial expanse or area will be found in Tables 1 and 2 of this issue. Table 1 shows the most recent area estimate for every geographic unit of the world; Table 2 shows aggregate area for each continent, region and the world. Unless otherwise specified, all of these figures are assumed to represent total area, that is, they comprise the land area and inland waters, excluding only polar regions and some uninhabited islands. Inland waters are assumed to consist of major rivers and lakes.

SOURCES OF VARIATION

Lack of comparability between area statistics arises primarily from differences in definition; for example, area defined as "land and water" cannot be considered comparable with land area figures unless the amount of inland water in a country is negligible. The term "water area" also may vary in meaning from one country to another; in one, it may comprise only major rivers and lakes (inland water in accord with the standard), while in others, it may include, in addition, coastal bays, inlets and gulfs. Variations of this type between countries with long coastlines or populated island territories can jeopardize comparability.

Another problem concerns the basic area data. Some area figures are based on geodetic surveys, carried out by modern scientific means; others are simply conjectures based on random items of information. Some values are of recent origin, reflecting current knowledge and significant territorial changes up to the present time; others are not so timely and may thereby fail to take cognizance of recent boundary rectifications. Since neither the exact method of determining the area nor the precise definition of its composition and time reference is known for all countries, the values in Table 1 should not be considered strictly comparable from country to country.

Apparent inconsistency with previously published figures may be due to the introduction of improved estimates, to increases in actual land surface by reclamation, or to a change in the unit of measurement used. In most cases, it was possible to ascertain the reason for a revision but, failing this, the latest figures have nevertheless been accepted as correct and substituted for values previously on file.

In this *Yearbook,* area is given in square kilometres, the conversion from square miles (if required) having been accomplished by equating 1 square mile to 2.589998 square kilometres. Use of a different factor would give slightly different results. Rounding also may affect the last digit of the value.

POPULATION

This thirteenth issue of the *Demographic Yearbook* features mortality statistics; therefore, population statistics are shown in only four tables, namely, Tables 1, 2, 4 and 5. Table 1 shows the geographic distribution of the world's 3 billion population; Table 2 shows world and regional aggregates; Table 4 shows the trend in a large number of countries and territories and Table 5 shows the current age/sex distribution. These may be considered the core of population statistics. They make available the types of data most often required in connexion with demographic analysis, and they also exemplify the types of variation which are common to population statistics as a whole. Recognized variations include difference in the constitution of "total" populations, variations in the amount of recognized underenumeration and omission at the census; and unreliability of unadjusted age distributions of population. These will be discussed below.

SOURCES OF VARIATION

Definition of total population

Variation in the coverage of the population totals for different countries is one of the most important factors to be considered in evaluating comparability.

De facto and de jure

The total population of a country is conventionally described as *de facto* or *de jure.* A true *de facto* or present-in-area concept usually implies that all persons physically present in the country—residents and nonresidents alike—have been counted in the local area where they were found at the time of the census. The *de jure* count, in contrast, comprises all persons who usually reside in the area, irrespective of where they might happen to be at the time of the census. Simple as these concepts appear, strict conformity to either of them is rarely found. Moreover, even when these terms are used with precision to describe the method of obtaining sub-national totals in a national census of population, they are often misleading when applied to the national figures in an international context. Also, the terms encountered may correctly describe the method of enumeration (i.e., place of residence *versus* place of occurrence) but be incorrect when applied to the tabulations.

Modified de facto (international conventional total)

In an effort to increase international comparability of the results of population censuses to be taken around 1950 and provide better information for constructing world and regional aggregates, the Population Commission recommended a "modified *de facto*" tabulation.[2] This same concept has been included in the *Principles and Recommendations for National Population Censuses,*[3] designed to provide guidance for the taking of the 1960 cycle of censuses. In these recommendations, the

[2] Report of the Population Commission (fourth session), document E/1313, pp. 16, 17.

[3] United Nations. Statistical Office. *Principles and Recommendations for National Population Censuses.* Document ST/STAT/SER.M/27, 1958, para. 403 (Sales No. 58.XVII.5)

new total is called the "international conventional total", and it is defined as "the total number of persons present in the country at the time of the census, *excluding* foreign military, naval and diplomatic personnel and their families located in the country but *including* military, naval and diplomatic personnel of the country and their families located abroad, and merchant seamen resident in the country but at sea at the time of the census".

In accordance with these recommendations, the population figures shown in this 1961 *Demographic Yearbook* —both censuses and estimates—are, in so far as possible, modified present-in-area counts or, in new terminology, international conventional totals. This means that (if applicable) they *include* data for jungle tribes, aborigines, nomadic peoples, displaced persons and refugees, together with national armed forces and diplomatic personnel and their dependants stationed outside the territory, and they *exclude* alien armed forces, alien diplomatic personnel, their dependants and enemy prisoners of war stationed inside the country.[4]

Accuracy of censuses

Total population

Irrespective of whether the census is *de facto* or *de jure* in concept, the obtaining of a complete yet unduplicated count of the population of any area presents numerous problems. These problems are, of course, more pronounced in areas where the inhabitants are unfamiliar with census-taking, but it should be emphasized that they are present in every enumeration.[5]

Measuring the amount of underenumeration by a post-censal field check or other means makes it possible to correct the total, but it is usually impossible to revise the distributions, except perhaps the geographic classification. Hence, the principal use of such measures is to point up the lack of completeness inherent in even the most carefully planned and executed census and to stimulate precision. To avoid misinterpretation in the various tables of the *Yearbook,* care has been taken to describe the census results, in so far as this is possible, as actually enumerated or adjusted, and to give the correction factor.[6]

Age distribution

Age — the characteristic most universally investigated both in population and vital statistics — is commonly determined on the basis of two types of questions, used singly or in combination. The first type asks the respondent for date of birth; the alternative method requires that the answer be given in terms of age in completed units of time, that is, age at last birthday—in years for adults and in months, weeks, days, or hours of life for infants. These two methods do not necessarily result in data of equal accuracy. There is evidence that the date-of-birth type of inquiry yields more precise data than the direct question, but it is obviously of limited applicability in areas where a large proportion of the population is illiterate or unable, for other reasons, to give the exact date of birth. On the other hand, the direct question on age also may be answered incorrectly, either through ignorance or deliberate misstatement.

Another source of variation may be found in the method of classifying the age data after they have been collected. The recommended method is to convert the date-of-birth information to age at last birthday by subtracting the exact date of birth from the date of the census. This age, which will be in the largest units of completed time, i.e., years, months, or days of age, would then be classified into selected age groups, or tabulated by single years if desired. This method of completed years is not always used, however. Some countries classify by the year of birth which is equivalent to determining "age" by finding the difference between the *year* of birth and the *year* of the census. In such a classification, all children born in the year immediately prior to the census year would be counted as one year of age even though, if they were born 30 November and the census were taken 1 January of the succeeding year, they had completed only one month of life. This type of classification can usually be identified by the fact that the under-one-year category appears smaller than it should be in relation to the succeeding categories. It should be noted, however, that for a year during which a large number of births took place, the effect may not be so clear.

Another source of non-comparability not universal in effect may result from cultural differences in the method of reckoning age, e.g., the Western *versus* the Eastern or, as it is usually known, the English *versus* the Chinese system. By the latter, a child is regarded as one year old at birth and advances one year at each Chinese New Year. The effect of this system is most obvious at the beginning of the age span where the frequencies in the "under-one-year" category are markedly understated. The effect on higher age groups is not so apparent. Distributions constructed on this basis are usually adjusted before publication, but the possibility of such aberrations should not be excluded in making comparisons of census data by age.

Misstatements of age may be due to numerous causes, among which may be cited ignorance of correct age; carelessness in reporting and recording; a general tendency to state age in figures ending in certain digits, such as zero, two, five and eight, to exaggerate at advanced ages; a possibly subconscious aversion to certain numbers such as 13; and wilful misrepresentations arising from motives of an economic, social, political or purely individual character. The above-cited reasons for misstatements are common to most investigations of age and to most countries and they may impair comparability to a marked degree.

As a result of these difficulties and differences in enumeration and classification, the age-sex distributions of population of many countries show irregularities which may be summarized as follows: (1) deficiency of infants and young children, (2) heaping at ages ending in 0 and 5, (3) a preference for even ages over odd ages, (4) unexpectedly large differences between the numbers of males and females at certain ages, and (5) unac-

---

[4] For a more detailed discussion of *de jure* and *de facto* concepts and the implications of these concepts in connexion with enumerations, see: United Nations Statistical Office. *Handbook of Population Census Methods.* Studies in Methods, Series F, No. 5, Rev. 1. (Sales No.: 58.XVII.6) Vol. I, *General Aspects of a Population Census,* pp. 91-92; Vol. III, *Demographic and Social Characteristics of the Population,* pp. 55-59.

[5] For further discussion, see 1956 *Demographic Yearbook,* Chapter I, pp. 9-11. Also, *Handbook of Population Census Methods,* Vol. I, *op. cit.,* pp. 104-111.

[6] For national estimates of underenumeration, see Table 1, p. 101.

countably large differences between the numbers in successive or adjacent age groups. Comparison of identical age-sex cohorts from successive censuses, as well as study of the age-sex composition in each census, may reveal these and other inconsistencies, some of which are characteristic of even the most modern censuses.

To measure the accuracy of age statistics in terms of digit preference (that is, preference for reporting age in figures ending in zero or five), Whipple's Index, known also as the Index of Concentration[7] was applied to a number of the age distributions of population from censuses taken between 1945 and 1954. The ratings achieved by 91 such distributions may be found in the 1960 *Demographic Yearbook* as well as in the 1955 and 1956 issues. If it is assumed that digit preference is usually connected with other sources of inaccuracy in age statements, these ratings can be accepted as a fair measure of the general reliability of the age distribution not only of the census returns but of intercensal estimates based on them.

Reliability of estimates

The reliability of a population estimate depends on the nature and quality of the statistics employed in its construction and the method by which these statistics are combined. An estimate is reliable if the probability of a relatively large error is slight or if errors in a given probability range are relatively small. A measure of reliability, defined in such terms, can actually be calculated, provided there is a quantitative appraisal of possible errors in each of the component factors of the estimate. For population statistics, such quantitative appraisals have been obtained systematically in relatively few countries. Accordingly, only rough assessments of reliability can be made in most cases, based on a consideration of the methods by which the current population estimates are obtained.

Evaluation of current population estimate

As a rough indication of the presumable degree of reliability in current estimates of total population, a code describing the manner of their construction was introduced experimentally in Table 1 of the 1949-50 issue of the *Demographic Yearbook*. With increased experience and knowledge, it became evident that the slight modifications introduced each year subsequent to 1952 were not adequate. By 1958, a more far-reaching modification seemed both feasible and necessary for two reasons: (1) it had become practicable to separate more clearly the logical elements which affected the reliability of each estimate, and (2) it was considered desirable to give more weight to the effect of the time which had elapsed between the date of the last basic population measurement (e.g., the last census) and the date of the current estimate. Accordingly, a new coding system was developed.

In constructing the new code, five elements have been recognized as affecting the reliability of a current population estimate; these are: (1) the nature of the base measurement of the population, (2) the probable error in that base measurement, (3) the time elapsed since the last measurement, (4) the method of time adjustment by which the base figure was brought up to date, and (5) the quality of the method of time adjustment. However, since very few comparable indications of the probable error in the base measurement have been secured so far, only elements (1), (3), (4) and (5) can be systematically considered. Hence, the revised code is composed of four parts, namely the nature of the base data, the recency of the base data, the nature of the time adjustment, and the quality of the time adjustment. The symbols of the code are listed below for ready reference. For a more detailed explanation, see the 1960 *Demographic Yearbook,* pp. 20-22.

Part I. Nature of base data (capital letter)
- **A** Complete census of individuals.
- **B** Sample census or survey.
- **C** Partial census or partial registration of individuals.
- **D** Conjecture.
- **..** Nature of base data not determined.

Part II. Recency of base data (subscript numeral following capital letter)
Numeral indicates time elapsed (in years) since establishment of base figure.

Part III. Method of time adjustment (lowercase letter)
- **a** Adjustment by continuous population register.
- **b** Adjustment based on calculated balance of births, deaths and migration.
- **c** Adjustment by assumed rate of increase.
- **d** No adjustment; base figure held constant at least two consecutive years.
- **x** Adjustment derived from regional population estimates.
- **..** Method of adjustment not determined.

Part IV. Quality of adjustment for types a and b (numeral following letter a or b)
- **1** Population balance adequately accounted for.
- **2** Adequacy of accounting for population balance not determined.
- **3** Population balance not adequately accounted for.

Quality of adjustment for type c (numeral following letter c)
- **1** Two or more censuses taken at decennial intervals or less.
- **2** Two or more censuses taken, but latest interval exceeds a decennium.
- **3** One or no census taken.

Evaluation of population time series

The code described above was designed to evaluate the reliability of the estimate of total population for a current date (mid-year 1960, in this instance). However, since there is usually a certain consistency in the manner in which countries prepare their population estimates from year to year, the code has some relevance also to the estimates for other recent years, perhaps, it may be assumed, to those available for the period 1955-1961.

The distinction between series in which the current estimates have been constructed by a method which is considered reliable and those the reliability of which is questionable has been made evident in Tables 4 and 5 by setting the less reliable estimates in italic type. For details of the method of evaluation, see the 1960 *Demographic Yearbook,* p. 22.

[8] Note suppressed.
[9] Note suppressed.
[10] Note suppressed.

For purposes of the *Demographic Yearbook,* vital statistics have been defined as statistics of live birth, death, foetal death, marriage and divorce. This is in accord with Principle 201 of the United Nations *Principles for a Vital Statistics System*[11] which defines the field of vital statistics as encompassing these, as well as statistics of adoptions, legitimations, recognitions, annulments and legal separations.

The factors which affect international comparability of vital statistics are much the same as those which must be considered in evaluating the variation in population statistics. Differences in geographic and ethnic coverage of the data; variation in the reliability of the statistics, i.e., in completeness of registration; diverse tabulation procedures; differences in statistical definitions of vital events—all these may influence comparability.

Standards for improvement of vital statistics in respect of these factors and others have been set forth in the *Principles for a Vital Statistics System.*[12] The utility of these international recommendations for improvement and standardization is further developed, and their application to national situations assisted, by a *Handbook of Vital Statistics Methods.*[13] The *Handbook* also discusses in detail the possible sources of error in vital statistics, which will be outlined below, and reference should be made to it for further details.

SOURCES OF VARIATION

Fragmentary coverage — geographic and ethnic

Despite the fact that the obtaining of statistics of live births, deaths, foetal deaths, marriages and divorces has been given priority in the United Nations recommendations, the availability of such statistics varies widely.[14] This is due in part to lack of uniformity and universality in national legislation. In some areas, registration is compulsory only for births and deaths; in others, it is compulsory for only a small part of the population (e.g., European, civilized or non-indigenous population). In still other countries, such as India and Pakistan, there is no national provision for compulsory registration, but only municipal or state ordinances which do not cover the entire geographic area. Still other countries (e.g., Indonesia) have developed registration areas which comprise only a part of the country, the remainder being excluded for reasons of inaccessibility or because of economic and cultural considerations that make regular registration a practical impossibility.

Examination of the tables will show that the vital-statistics coverage for Africa is particularly spotty, being confined largely to data for the European population with, as a rule, only a few partial statistics and estimates for the indigenous segments. Similarly, the coverage is uneven and the statistics incomplete and unreliable for much of Asia and parts of Latin America. The fragmentary nature of available statistics is one important limitation to international comparability.

Reliability

In addition to the variations which arise because of lack of national provision for civil registration, there are also differences in the effectiveness with which national laws operate in the various countries. The manner in which the law is implemented and the degree to which the public complies with the legislation determine the reliability of the vital statistics obtained from the civil registers.

Evaluation of current vital statistics

Deficiencies in vital statistics are often fairly obvious. An examination of the computed or implied rates will sometimes indicate the cases for which a presumption of incompleteness is probably justified. However, this technique applies only where the data are markedly deficient and where they are tabulated by date of occurrence; tabulation by date of registration will often produce rates which are large enough to appear correct, simply by including therein many delayed registrations. Moreover, it should be remembered that knowledge of "expected" levels of fertility, mortality, and nuptiality is extremely scanty for many parts of the world and that borderline cases, which are the most difficult to appraise, are frequent.

However, an evaluation of quality based solely on examination of the tabulated series can be very misleading. To obtain more basic information on this point, the United Nations in 1956 made a special effort to obtain national estimates of the completeness and accuracy of vital statistics, using the *Demographic Yearbook* annual questionnaire to carry out the survey. This 1956 inventory has been systematically extended and refined as new information on reliability became available.

On the basis of information accumulated from the questionnaire, from direct correspondence or from relevant official publications, it has been possible to classify national vital statistics into three broad quality categories, as follows:

- **C** Those stated to be relatively complete, i.e., representing at least 90% coverage of the events occurring each year.
- **U** Those stated to be unreliable, that is, less than 90% coverage.
- **...** Those concerning which no specific information is available.

The way in which the classification was made did not permit the application of uniform, objective criteria with respect to reliability. In many cases, the basis for the country's own evaluation of the data was not given. Nevertheless, it was felt that under the circumstances national statistical offices were in the best position to judge the quality of their data and that even the two very broad categories that could be established on this basis,

would be useful in furnishing some indication of the reliability of the statistics presented in this *Yearbook*.

The results of this classification (**C**, **U** or **...**) appear in the first column of trend tables, Nos. 6, 8, 11, 12, 14, 27 and 29, which show total frequencies and rates for live births, foetal deaths, perinatal deaths, infant deaths, deaths, marriages and divorces. Here also, in the form of footnotes, will be found the exact values—when they exist—upon which the **U** code was based.

In addition to showing the quality code in each trend table, data coded **U** and those for which reliability is unknown (**...**) are typeset in italics to distinguish them quickly from more reliable figures.

Despite the fact that the code is presented only in connexion with the trend tables, it is of course applicable to recent vital statistics for the country in question wherever they appear in the *Yearbook*. Thus, in using data from Tables 6-29, reference should be made to the quality code before any comparisons or analyses are attempted. In the case of the life-table functions in Table 24, 25, and 26, adjustments have usually been made for deficiencies in the basic data.

By definition, the code in its present form is interpretable only in relation to data tabulated by date of occurrence (see below). Date-of-registration tabulation automatically cancels its applicability, inasmuch as the **"C"** and **"U"** are designed to indicate complete or incomplete registration—within the year or shortly thereafter—of those events which have occurred during the year.

Evaluation of vital-statistics time series

Evaluation of the quality of a time series of vital statistics is a more difficult matter. Since estimates of current reliability are based on conjecture in large part, objective evaluations for prior years tend to be non-existent. In the absence of earlier measures of reliability, therefore, it was decided to assume that the quality of the entire series was the same as that for the current data; hence, the time trends are set in italics if the code for the current year is unreliable (**U**) or unknown (**...**).

It is recognized that this method is not entirely valid, because it is known that in earlier years, many of the series were considerably less reliable than the current code implies. But, since it was felt that a more obvious means was desirable for identifying data whose reliability was questionable and since the effect is to overstate rather than understate reliability, the current code has been used as a basis of classification—despite its deficiencies. Likewise, it has seemed justifiable to assume that data for which the degree of completeness was still unknown might be considered as unreliable and set in italics, together with those coded **U**.

Strictly speaking, the reliability code relates specifically to the vital-statistics frequencies and, therefore, only indirectly to rates which depend also on population figures. However, it should be pointed out that the two components of the rate are not unrelated, particularly where vital statistics have been utilized in the preparation of the population estimates. Therefore, rates based on unreliable statistics are shown as unreliable even though their magnitude may appear credible for one reason or another. A fuller evaluation of current rates may be made by considering also the implications of the evaluation of population estimates presented in Table 1 and Table 4.

Tabulation Procedures

Place-of-occurrence statistics

In accordance with part (*c*) of *Principle* 409,[15] vital statistics shown in this *Yearbook* relate to the *de facto* or present-in-area population. Thus, unless otherwise noted, vital statistics include events which occurred within the present boundaries of the geographic areas shown and among all segments of population therein. Footnotes are used only to show deviations from this present-in-area concept, except in the case of deaths among the armed forces; for clarity, the disposition of these deaths is explained in so far as possible, irrespective of whether it constitutes a deviation from the standard procedure.

The need of distinguishing for national purposes between statistics for areas or populations where registration is moderately complete and those in which it is incomplete, has been recognized in *Principles* 402 and 403.[16] In line with these *Principles,* statistics for some countries regularly exclude data for a segment of the population in which registration, though compulsory, is not even moderately complete, and for which therefore the statistics are very unreliable. Countries which follow this procedure include Panama and Venezuela, where vital statistics exclude data for the tribal Indian population; Peru, whose jungle population is excluded; British Guiana, Surinam, Syria and Australia, where statistics for nomadic aborigines are not included. These cases, as well as others where the geographic area or population covered by the statistics is less than the entire country, are noted in the tables.

By date of occurrence versus date of registration

In so far as possible, the vital statistics presented in the *Demographic Yearbook* refer to events which occurred during the specified year, rather than to events which were registered during the period. This is in accord with the United Nations *Principle*[17] on this subject.

Symbol: Reference to the tables will reveal, however, that despite this international recommendation, a considerable number of countries tabulate their statistics not by date of occurrence but by date of registration; moreover, very few of these have analysed the results with a view to proving their adequacy as measures of natality or mortality. Because such statistics can be very misleading, the countries known to tabulate vital statistics by date of registration are identified in the tables by a dagger symbol (†). The absence of the dagger, therefore, indicates date-of-occurrence tabulation but, since complete information is not available, this assumption may overstate the occurrence group to some extent.

Because this factor is so inextricably related to the delay in registration, it must always be considered in conjunction with the quality code with which it appears on the trend tables. Obviously if registration is "complete" (**C**), the ill effects of tabulating by date of registration are for all practical purposes nullified. For this reason, the qualification is less applicable to death than to birth

[15] *Principles for a Vital Statistics System, op. cit.*, p. 18.
[16] *Ibid.*, p. 17.
[17] *Ibid.*, *Principle* 408.

statistics, because in most countries the sanitary code requires that deaths be registered before a burial permit can be issued and this regulation tends to make registration prompt. The symbol is even less meaningful in relation to marriage statistics because in most countries, marriages are registered immediately as part of the ceremony or within a reasonably short period thereafter. It is least applicable to foetal-death statistics because of the need for a burial permit and because delayed registration of foetal deaths is probably almost non-existent.

Effect on comparability: If, as noted above, registration is prompt, the difference between statistics tabulated by the date of occurrence and date of registration might be negligible. In such cases, the only factor limiting comparability is the length of the statutory time period allowed for current registration.

If, on the other hand, registration is not prompt, if delayed registration exists to any substantial degree, vital statistics by date of registration will not produce internationally comparable data. Under the best circumstances, statistics of registrations will include primarily events which occurred in the immediately preceding year; in countries with less well-developed systems, they will include many of longer durations. Examination of evidence available for the United States, Costa Rica, Chile and the Dominican Republic reveals that delays of up to 20-25 years are not uncommon for birth registration, though the majority are recorded between 2 and 4 years of birth. As registration completeness and promptness improve, date-of-registration tabulations will approximate more closely the true frequencies for the year in question but, until this time is reached, the statistics by date of registration will not be internationally comparable.

It should also be mentioned that lack of international comparability is not the only problem introduced by date-of-registration tabulation. Even within the same country, comparability over time may be lost by the practice. If the number of events registered from year to year fluctuates to any extent (due to *ad hoc* incentives to stimulate registration or to the sudden need for proof of birth or death to meet certain requirements), vital statistics tabulated by date of registration cannot provide a measure of the level of natality or mortality; nor can they provide an indication of the trend. All they can give is an indication of the fluctuations in the need for a birth, death or marriage certificate. If, on the other hand, registration completeness is not sporadic but steady from year to year, or—in fact—improving, an apparent rise in the birth and death rates may be mistaken for evidence of changes in the incidence of births and deaths. In both cases, statistics of birth and death registrations are of very limited use for either national or international studies.

Statistical definition of events

Another source of variation—though a much less important one—lies in the statistical definition of vital events. It is important, for example, to establish a uniform and definite criterion differentiating statistically between foetal deaths and live births.

In some countries, namely Spain, Cuba, Ecuador, and the Spanish possessions of Ceuta and Melilla, a child must survive for at least 24 hours before it can be inscribed in the live-birth register. Infants who die before the expiration of the 24-hour-period are classified as *abortos* and, failing special statistical provisions, would not be counted as either a live birth or as a death. Similarly, in several other countries,[18] those infants who are born alive but who die before registration of their birth irrespective of the age at death, are considered as "stillbirths" and are thus excluded from both the live-birth and the death statistics.

Unless special tabulation procedures are adopted in such cases, the live-birth and death statistics will both be deficient by the number of these infants, while the number of late foetal deaths will be increased by the same amount. As a result, late foetal death ratios will be exaggerated and general birth and death rates understated to some degree. The infant mortality rate will be affected for, although both components (infant deaths and live births) are deficient by the same absolute amount, the deficiency is proportionately greater in relation to the infant deaths and the rate tends to be understated.[19]

Lack of comparability due to different statistical definitions is found also in statistics of marriage and divorce. Even though marriage and divorce are legal rather than biological events and thus presumably less subject to variation in definition, conceptual differences between countries do affect the statistics. Further details have been given in Chapter II of the 1958 *Demographic Yearbook,* which featured marriage and divorce statistics.

LIVE-BIRTH STATISTICS

Because this issue of the *Yearbook* is devoted chiefly to statistics of mortality, the subject coverage for birth statistics has been restricted to basic data for which continuity is required each year, namely, to time trends and to births by age of mother. These will be found in Tables 6 and 7, respectively.

For purposes of these tables, live birth has been defined in accordance with the international definition set forth in the *Principles for a Vital Statistics System*[20] and in the 1959 *Demographic Yearbook.* The variations in the data are discussed briefly in connexion with Tables 6 and 7; for general limitations of live birth statistics, see the 1959 issue of the *Demographic Yearbook,* where natality statistics were featured.

FOETAL-DEATH STATISTICS

Foetal-death statistics may be considered as components of the mortality picture as well as in relation to natality and pregnancy wastage. Hence, foetal-death statistics tables have been expanded in this mortality volume to complement the feature subject. Three tables showing foetal deaths are included as well as one showing perinatal mortality; these are Tables 8-11, inclusive.

The basic definition of foetal death, upon which statistics are compiled, is the international standard,[21] as follows:

> *Foetal death is death prior to the complete expulsion or extraction from its mother of a product of*

[18] Algeria, Belgium, France, Guadeloupe, Martinique, Morocco, Netherlands Antilles, Reunion, St. Pierre and Miquelon, and Surinam.

[19] For more precise evaluation of these effects, see *Handbook of Vital Statistics Methods, op. cit.,* Chapter IV.

[20] *Op. cit., Principle* 202.

[21] *Ibid.*

conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation the foetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord, or definite movement of voluntary muscles.

"Late foetal deaths" are defined as those of "twenty-eight completed weeks of gestation or over". These are synonymous with the events reported under the pre-1950 term "stillbirth".

Limitations of the Data

Comparability of foetal-death statistics is markedly affected by differences in definitions, by variations in reliability and by tabulation procedures. A fuller discussion of these problems can be found in Chapter IV of the *Handbook of Vital Statistics Methods,* but one or two salient points will be set forth below.

Completeness of data

Foetal-death statistics more than any other are subject to severe limitations as regards completeness of registration. It would appear that even with a highly efficient registration system, a considerably greater proportion of foetal deaths than of live births or deaths escapes registration. However, it is difficult to measure or estimate just what fraction of the total number occurring go unregistered; consequently, not as much precise information on completeness of coverage will be found on these tables as is given for live births and deaths.

Definitions

The comparability of foetal-death statistics is affected strongly by differences in definition. Principal of these are the differences in what is to be registered as a "stillbirth" or "late foetal death" when registration of all products of conception is not mandatory. These are the criteria of viability, which are usually based on the duration of pregnancy—measured in days, weeks or months. The minimum period of gestation specified varies widely, ranging (according to available information) from 3 to 7 months. The interval most frequently specified as the minimum is 28 weeks. Some countries have an additional requirement that the foetus be a minimum length, the minimum specified ranging from 30 to 35 centimetres. In a number of cases, the only specification is simply that the foetus must be viable or that it must be recognizable as a human being.

Although full information on how "stillbirths" are defined could not be obtained for all the areas and years for which "stillbirth" data are shown in this volume, some information on current practices is available for most of the areas; this is indicated in Table 10 where distributions by gestational age are shown.

As has already been pointed out above, some countries register live-born infants dying shortly after birth (and before the birth has been registered) as "stillbirths". Such deaths may occur as many as 3 days after birth; hence, stillbirth or late foetal-death statistics may be inflated to a rather high degree. Theoretically, corrections can be made in the figures so long as these pseudo-stillbirths are tabulated separately from the true stillbirths. This is done in some countries, but such a correction can be applied only to the gross totals. The countries where these procedures apply are pointed out in Table 8.

DEATH STATISTICS

Since the feature subject of this issue of the *Demographic Yearbook* is mortality, the series of death statistics occupy 15 tables of the 29 in the book and over 70 per cent of the pages devoted to tabular work. Trends of total mortality, infant, foetal and perinatal mortality show average rates for 1945-1959 and single year data for 1952-1961. The distributions by characteristics in general cover the period 1955-1960. Thus, an overlap of several years is provided with the tables shown in the last previous mortality issue (1957 *Demographic Yearbook*) and using both issues, trends of total mortality beginning 1930 can be assembled.

For purposes of these tables, death has been defined in accordance with the *Principles for a Vital Statistics System*[22] as follows:

Death is the permanent disappearance of all evidence of life at any time after live birth has taken place (post-natal cessation of vital functions without capability of resuscitation).

By definition, the figures exclude foetal deaths except in a few cases noted in the tables and, in these, the presumption seemed warranted that the number included was too small to invalidate the data.

Normally all deaths of live-born issue are included but, because of the legal definition of live birth in some countries (see p. 18 above), deaths of infants who died before registration of birth or before 24 hours of age are excluded from the totals for certain countries. This exclusion is potentially an important one, inasmuch as deaths up to three days after birth (a period at which mortality tends to be high) may thus escape registration and counting.

The data presented relate to deaths which occurred in the population present within the current boundaries of the given country. Therefore, unless otherwise specified, they may be presumed to include deaths among nomadic tribes and aborigines and those among national or alien armed forces, displaced persons, war refugees, and aliens residing in the country at the time when death occurred. They normally exclude deaths among armed forces and civilian nationals stationed or residing outside the country.

In theory, adherence to the standard described above would require no explanatory footnotes. However, because this issue is devoted primarily to mortality statistics and because some of the tables included cover the period of World War II, every effort has been made to give information available on the deaths of members of the armed forces—those stationed in their native country and those stationed elsewhere. In view of the standard, these notes may appear redundant but they do serve to clarify this important component of the mortality picture. It should not, however, be assumed that absence of qualifying notes in respect of inclusions or exclusions necessarily indicates conformity to the standard, though in most cases, the assumption is probably justified.

[22] *Ibid.*

Because under-registration of deaths is more difficult to detect or measure than under-registration of births, the quality-of-data code columns in the tables presenting foetal, perinatal, total mortality and infant mortality contain more "unknowns" (...) than does that in the table of birth statistics. It is generally believed that deaths are more completely registered than births, but this may not be the case everywhere. In fact, evidence is beginning to accumulate which suggests that, in some areas and under certain conditions, births may be more fully registered than deaths. According to an analysis of data for 1951-1955,[23] only about 33 per cent of the world's deaths were being registered—a percentage whose regional range is from 7 for East Asia to 100 in Northern America and Europe. For births, the corresponding ratio was 42 per cent.

The tables have been carefully cross-checked and compared for consistency. Wherever unaccounted discrepancies in either numbers or rates were disclosed, they have been pointed out in footnotes irrespective of their magnitude.

LIFE TABLES

Life tables are based on observed mortality conditions for a selected time period, but they permit a more detailed analysis of the implications and prospects inherent in those conditions than do conventional central death rates.

Three principal functions are given in this *Demographic Yearbook:* (1) the probability of dying within one year or within a specified age interval for persons of exact ages specified (q_x); (2) the survivors at the beginning of each age interval out of a generation of 100,000 (l_x); and (3) the mean expectation of life or the average future lifetime for persons at exact ages specified $(\mathring{e}_x)$.

Details of procedure in life-table construction vary somewhat, depending in large measure upon the availability and form of the basic data. The basic data ordinarily consist of deaths in a given period classified by single years of age and sex and the mean population of that age and sex during that period. The values of the life-table mortality rate (q_x), which is the basic function of the life table, are generally so derived as to correspond to the death rates of persons of that age and sex in a particular period of time.

The most usual procedure is to utilize statistics of deaths in a three-year or five-year period centred at the census date so that the census results can be taken as the mean population. Sometimes the period covered is that between two censuses, and the population figures utilized are averages of the results of the two censuses. It is common to make adjustments to correct for misstatements of age in the census and death statistics and to obtain successive values of q_x which vary smoothly from one age to the next; a correction for the effect of migration is occasionally made. In a few rare cases (for example, in Brazil and India), approximate life tables have been computed without the use of data on deaths, by deriving q_x values from the comparison of the population in each age group as enumerated at one census with the survivors at the next census.

The number of persons surviving to successive ages of life is obtained by diminishing the initial arbitrary cohort (usually 100,000 persons) by the application of the mortality rate specific for that age. These survivors are represented by the symbol "l_x" which stands for "persons living at age x".

Computation of the number of survivors (l_x) produces also the number of persons dying in each age interval (d_x) and additional manipulation produces the number of years lived by the cohort between age x and $x + 1$ (L_x) as well as the cumulative number of years lived by the cohort from age x until all have died (T_x).

The average future lifetime of persons at each age specified $(\mathring{e}_x)$ is then computed by relating the total number of years lived (T_x) to the survivors at each age (l_x).

Though first developed for actuarial purposes, the life table has many applications in the demographic field. Among these are: (1) the preparation of population projections by age and sex, (2) analysis of effects of mortality on the age and sex composition of a population, (3) comparisons of summarizing measures of mortality, such as the life-table death rate (the reciprocal of the expectation of life at birth), expectation of life at various ages, etc., (4) computation of net reproduction rates, and (5) the appraisal of the accuracy of census enumerations and vital-registration data. In addition, life-table techniques have been applied to the analysis of other types of demographic data, for example, in the computation of probabilities of marriage specific for age and sex, on the basis of census data classified by marital status.

The accuracy of life tables depends mainly upon the accuracy and completeness of the registration of deaths and of the enumeration of the population at the census. Deficiencies in death registration are likely to be greater than corresponding defects in census enumeration. Where this happens, death rates are understated and the l_x (survivors) and $\mathring{e}_x$ values are exaggerated. The mortality rates computed from population and death statistics at the very young ages are particularly likely to be understated, and such an error affects the l_x values throughout the table. As indicated earlier, infant mortality rates obtained by relating the number of infant deaths to the number of births in countries where registration is deficient may be either too low or too high, and the error in either direction may have an important effect on the l_x values for every age. The expectation of life at birth $(\mathring{e}_0)$ will also be too high or too low.

The accuracy and the international comparability of life-table values are particularly suspect at the highest ages. Those values depend on imperfect data and frequently on somewhat arbitrary procedures. Certain remarkable features—for example, the fact that the expectation of life at ages over sixty is often distinctly higher in countries where mortality in general is heavy than in countries with low death rates—may, thus, merely reflect imperfections of the tables.

Differences in the methods used for constructing life tables (adjustment of data, graduation, etc.) may affect the reliability of the results and impair their international comparability. The effect of such differences is, however, probably much smaller than that of deficiencies in censuses and in death registration.

MARRIAGE STATISTICS

The trend of marriages and their distribution by age of bride and groom constitute the coverage in this issue.

[23] See the 1956 *Demographic Yearbook,* Chapter I, Table 1, p. 14.

In accordance with the recommendation made in the *Principles for a Vital Statistics System,*[24] the statistics refer, unless otherwise noted, to formal, legal marriages. The effects of variations in definition, as well as other sources of non-comparability, are discussed briefly in connexion with Tables 27 and 28; for a more detailed treatment of these factors, see pp. 17-18 of the 1958 *Demographic Yearbook,* where this subject was featured.

DIVORCE STATISTICS

Time series of statistics on dissolution of marriage by divorce have been set forth in Table 29. Unless otherwise specified, the definition used in compiling these statistics was that recommended in the *Principles for a Vital Statistics System,*[25] that is, statistics refer to final legal dissolutions of marriage which confer on the parties the right to remarry.

The effects of variations in definition, as well as other sources of non-comparability, are discussed briefly in connexion with Table 29; for a more detailed treatment of these factors, see pp. 18-19 of the 1958 *Demographic Yearbook,* where this subject was featured.

[24] *Op. cit., Principle* 202.

[25] *Ibid.*

DESCRIPTION OF TABLES

Table 1

Table 1 presents the results of the latest census of population distributed by sex, the 1953 and 1960 estimates of population in thousands, the type of the 1960 estimate, the average annual per cent rate of population growth (or decrease) between 1953 and 1960 and the current area and population density for each country and territory of the world.

The countries and territories are arranged by continents, with those in Africa appearing first, followed by those in North America, South America, Asia, Europe and Oceania; the USSR is listed last, since it is partly in Europe and partly in Asia. Within each continent, sovereign States are shown first, in English alphabetic order, followed by non-sovereign territories set forth under the name of their respective administering authority and also distinguished as to their administrative status, i.e., dependencies, trust territories, condominiums, military government and so forth.

In so far as possible, the geographic and administrative classification reflects the situation as of 31 December 1961. It, together with the extensive footnotes which describe the boundaries of the areas in a detail not found elsewhere in the *Demographic Yearbook,* makes this the reference table of the volume in respect of sovereignty and territorial composition. It is also the reference for nomenclature in English and French, incorporating as it does the most recent official forms of country names.[26]

Unless otherwise indicated, both census results and estimates relate to the modified present-in-area population as described on p. 14.

In so far as possible the figures presented in the census columns of Table 1 are the results of enumerations[27] or sample surveys designed to obtain a count of individuals. Censuses to be included need not be national in scope; they may cover only part of the territory or only one segment of the population, and they may be more or less complete in terms of underenumeration. On the other hand, demographic sample survey results to be included in Table 1 must provide an estimate of population which is national in character. Thus, results of surveys limited to sub-national geographic areas are not included.

The inclusion in Table 1 of all censuses provides an inventory of recent census-taking activities throughout the world. It makes possible the identification of countries which have never carried out any type of census, those which have taken a census of limited scope in terms of persons enumerated and those which have taken a true national census. The practice of including national sample survey results provides the same information for this increasingly popular method of estimating population, and it also makes available base population figures for areas which either have had no previous census or none in recent years.

Unless otherwise specified, estimates refer to the midyear, i.e., to the population at 1 July of the relevant year or to the mean of the two proximate end-year estimates. No distinction is made between these two types of midyear estimates, on the assumption that the difference involved is negligible.

When an acceptable midyear or mean estimate was not available for 1953 or 1960, the results of a census of population carried out during the year were substituted. The substitution of census returns for an estimate was further employed in this table in that 1960 estimates which appeared not to be in accord with the census results of 1960 or 1961 were eliminated in favor of the enumerated figure even though the latter referred to 1961. This policy resulted in 7 cases where there is no 1960 estimate of population size shown in Table 1 but rather a "best estimate" in the form of the 1961 enumerated total; 1953 estimates which appear out-of-line with 1960/61 census results are footnoted. All census returns are shown in boldface type to distinguish them readily from estimates. For the correct time reference, see the column of census dates adjacent.

Finally, in one or two cases where neither an enumerated population nor an official estimate was available, unofficial estimates have been shown for 1953 and/or 1960 in order to provide an idea of the current size of the population in every part of the world. Such unofficial estimates are identified in the table by the symbol "x" or a footnote specifying their source.

The type-of-estimate code, the construction of which was described in detail on p. 15, is included in this table. Together with information on underenumeration, the

[26] See p. 12.

[27] For a definition of a census and methods of enumerating, see *Handbook of Population Census Methods,* Vol. I, *op. cit.,* pp. 4, 89, 98.

code furnishes the basis for fairly precise evaluation of the 1960 estimates of population—wherever they appear—and it may also be assumed to apply less precisely, perhaps, to the estimate for 1953. On the basis of this assumption and other available information as described on p. 15, estimates for both years have been classified as reliable or of questionable reliability, and those believed to be of questionable reliability are set in italics rather than in roman type.

The code has been omitted in two instances, namely where an estimate for the current date (1960) was not available and where the value for an area was a composite, resulting from addition or subtraction of estimates for component areas derived by varying methods. Where the code has not been applied, the fact is indicated by one dot (.). Although codes are shown for all estimates other than the above, it should be emphasized that the classification for some of the small populations is quite inadequate as an assessment of their presumable reliability. This is so because some small populations are estimated by methods not easily classifiable by the present scheme, and others are disproportionately affected by the frequent arrival and departure of migrants, visitors, etc., with consequent relatively large variations between *de facto* and *de jure* population, as variously defined.

The area figures, given in square kilometres, relate to the total area of the specified geographic units, including inland water as well as such uninhabited or uninhabitable stretches of land as may lie within the boundaries. Wholly uninhabited areas, such as the polar regions and a few small islands, are usually excluded from the statistics. Area estimates are official unless marked with the symbol "x" and those reported in square miles have been converted to square kilometres, using the factor 2.589998.

Coverage: Table 1 includes data for 262 separate geographic units, that is, all countries, territories and component parts of collective territories each of which has at least 50 inhabitants. The stub of this table is, therefore, the most comprehensive of any in the *Demographic Yearbook.*

Computation:

Rate of increase: The average annual per cent rate of change in population size between 1953 and 1960 has been computed from data in the table, using the following formula:

$$P_1 = P_o\ (1 + r)^t \times 100$$

where P_o is the population in 1953,
P_1 is the population in 1960,
t is 7 (years between 1953 and 1960), and
r is the annual rate of change.

Although population estimates in Table 1 appear only in thousands, figures in unit digits were used whenever possible for the computation and rates were computed to two decimals and rounded to one for publication.

No rate was computed where the 1953 estimate in thousands appeared to be identical with the 1960 estimate, even though the figures in units probably differed slightly. In these cases, a symbol of one dot (.) was used to signify that a rate was not applicable under the circumstances. A new departure in this issue was the inclusion of rates formerly excluded for populations of less than 50,000. This policy was adopted to maintain consistency with tables showing time trends of intercensal rates of growth where all areas appear.

Density: Unless otherwise indicated, density is the number of persons in the 1960 total population per square kilometre of total area. This index has been computed for every geographic unit for which the two components were available. Where two area figures are given —for example, one for administrative boundaries and one for habitable land—the habitable area is the base for the density computation.

Limitations: The population data given in this table are subject to the limitations of population statistics in general, namely variations in definitions and tabulation methods, deficiencies in completeness of the basic count and differences in the method of constructing estimates—all of which were discussed above on p. 13. To assist in assessing comparability, the degree of underenumeration in the population census has been given when known, and the reliability of the estimates may be ascertained by reference to the type-of-estimate code and to the type-face in which the figures are set. For guidance in interpreting the terms *de facto* and *de jure* in relation to data in this table, reference may be made to Table A, in the 1960 *Demographic Yearbook.*

Per cent rates of population growth are subject to all the qualifications of the basic population figures mentioned above. In some cases, they admittedly reflect simply the rate calculated or assumed in constructing the estimates themselves in the absence of adequate measures of natural and migratory increase.[28] For small populations an error up to ±0.5 may be introduced by chance alone. Moreover, with the 1960/61 census results becoming available, some of the 1953 estimates have been found to be too low and their use in the computation of the rate of growth results in one which appears to be overstated. Care should be taken to examine carefully the two components of the rate, in order to guard against misinterpretation. Despite their shortcomings, these rates do provide a useful index which—with proper precautions—can be useful also in evaluating the accuracy of vital and migration statistics.

Comparability of area figures is limited by all factors set forth on p. 13 above. It should be emphasized that density values are very rough indices, inasmuch as they do not take account of the dispersion or concentration of population within areas.

Table 2

This table presents comparable estimates of world population by continental divisions and regions for each tenth year, 1920 to 1960, together with the average annual per cent rate of population increase between 1950 and 1960, estimated birth and death rates for the period 1956-60, the 1960 area in square kilometres and the population density for that year.

The population estimates in this table were based on official figures shown in Table 1, but they include in addition an adjustment for under- or over-enumeration at the various censuses and for under- and over-estimation, an allowance for categories of population not regularly included in the official figures and an estimate for

[28] See 1956 *Demographic Yearbook,* p. 13.

those countries which have not yet provided official 1960 data. Because of these adjustments, regional and continental sub-totals do not necessarily coincide with those which would result from summing the component parts in Table 1. Moreover, estimates for prior years might have been reconstructed to take account of newly acquired current information, resulting in data which differ from those shown in previous issues of the *Demographic Yearbook*. Hence, the regional and world estimates in the latest version of Table 2 are considered to supersede all previously published figures of this type. Because of rounding, the regional and world totals are not in all cases the sum of their parts.

The regional, continental and world area totals were obtained by summing the figures for individual geographic units shown in Table 1; they, therefore, include inland waters but exclude polar regions and a few uninhabited islands. In interpreting the population densities, note should be taken of the fact that most of the regions include large areas of land that are only barely habitable, and density values such as those shown make no allowance either for the uninhabitable land or for dispersion or concentration of population within these areas.

Coverage: The 14 regions designed to meet the needs of demographic statistics are sub-divisions of continents and are constituted of countries and territories as set forth and defined in Table 1. They have been delineated in terms of present *de facto* boundaries and all retrospective figures, having been adjusted for boundary changes, refer to constant areas. The composition of each region is as follows:

AFRICA

Northern Africa
- Algeria
- Ethiopia
- French Somaliland
- Ifni
- Libya
- Morocco
- Somalia
- Spanish Possessions in North Africa
- Spanish Sahara

UNION OF SOVIET SOCIALIST REPUBLICS

Rate computation:

Rate of increase: Per cent rates of increase have been calculated by the method explained in connexion with Table 1, except that the time period (^{t}) here relates to the 10-year period 1950-1960, rather than to the 7-year 1953-1960.

Birth and death rates: The estimated average annual birth and death rates for the 5-year period 1956-1960 have been derived from a study of the range of recorded rates in each country or territory in the region, and such official estimates of natality and mortality as may have been obtained from sample surveys, analysis of consecutive census returns and the like. The method involves rank-ordering the recorded or estimated birth rates and death rates observed in each region; subtracting the observed population rate of growth for the region from the lowest and the highest birth rate in the range and adding it to the lowest and highest death rate in the range, to produce two other possible birth and death rates consistent with the components; arranging the four potential birth and death rates in rank order, and by a process of averaging, arrive at one birth rate and one death rate which together most nearly and reasonably produce the observed regional population growth rate. Continental rates are weighted averages of regional rates. Wide discrepancies between the population growth rate and the natural increase rate obtained as described above were assumed to be due to migratory movements; these cases are noted in the tables.

Limitations: Being derived essentially from data in Table 1, the estimates of population and area in Table 2 are subject to all the basic limitations set forth in connexion with that table.

Likewise, the population-increase rates and density indices computed on these base data are also affected by the limitations of the original figures. However, it may be noted that in aggregating data for regional and continental totals, errors in the components may tend to compensate each other and the resulting aggregates may be somewhat more reliable than the quality of the individual components would imply.

Because of their purely estimated character, most of the birth and death rates shown should be considered only as working indices, and not as measures of the true level of natality or mortality. Even in the areas for which rates are estimated from recorded statistics, they are subject to all the limitations of those statistics, as set forth on p. 16.

Despite the fact that the method of estimation is the same as that used in constructing the average rates for 1951-55, 1952-56, 1953-57, 1954-58 and 1955-59 shown in the five previous issues of the *Demographic Yearbook,* rates for 1956-60 should not be considered comparable with those previously derived, nor should the set be considered a time series. Each series is based on the data available at the time of estimation, and much new information has been taken into account in constructing the estimates for 1956-60.

Table 3

This table, which was first shown in the 1958 *Demographic Yearbook,* is an attempt to bring together current rates of birth, death, marriage, divorce, infant mortality, fertility, natural increase, and expectation-of-life at birth values for countries and territories where birth and death rates are considered reliable.

Recorded rates for the latest available year are shown and, where these have been evaluated in terms of completeness of registration, the additional measures are given in footnotes. Where recorded statistics are unreliable but a relatively accurate estimate of the national birth and death rate has been made, these have been included in the table—suitably identified. The effects of this policy are evident particularly in Africa and Asia, where vital statistics are notably defective but where apparently reasonable estimates have been derived from demographic survey results. Constructed in this way, the table meets the need for a ready reference to current, more or less comparable rates. It must be emphasized, however, that special qualifications have had to be omitted for lack of space, and reference must be made to the corresponding trend tables for more precise information in terms of coverage, basis of tabulation and general limitations.

The reference date set forth in the table is that common to the birth and death rates; when the date for other rates differs from this, it is given in a footnote.

Coverage: Table 3 contains rates for 117 countries and territories. These are the areas considered to have a reliable birth and death rate, that is, those where registration of births and deaths is reported to be at least 90 per cent complete and those for which, in the absence of complete registration, a reliable estimate of the birth and death rate has been made.

Only national rates or those for the major ethnic group appear in Table 3; rates for cities, minor civil divisions or minor ethnic groups have not been included, inasmuch as the table's function is to provide indices which are presumed to be representative of those for the country as a whole.

Rate computation: Crude annual birth, death, marriage and divorce rates derived from civil registers are the number of events reported for the calendar year cited, per 1,000 persons present in the same geographic area at the midpoint of the year in question. For estimated rates, the method (if known) is given in footnotes to the table.

Infant mortality rates are the number of deaths which occurred under one year of age, per 1,000 live births in the same period, no adjustment having been made for the non-correspondence of the numerator and denominator.

Fertility rates are the number of live births in the calendar year per 1,000 female population aged 10-49 years.

Natural-increase rates are the difference between the crude birth and death rates.

Limitations: Since most of the rates and all of the life expectancies are presented also in other tables in this or previous *Demographic Yearbooks,* reference should be made to the corresponding basic compilation and to the *Handbook of Vital Statistics Methods*[30] for details of limitations and qualifications.

In assessing comparability, special attention should be paid to the relative degrees of completeness as expressed in the quality code in each trend table and the footnotes appended thereto, and to the basis for the estimated rates. Variation in the basis of tabulation (i.e., date of occurrence *versus* date of registration) is another potential source of noncomparability which should be borne in mind in using the rates on an international basis. Finally, the noncorrespondence of the time reference might also need to be considered in comparing the various rates with each other and with those for other countries.

Table 4

Estimates of total population for each year 1941-1961 are presented in Table 4. All figures are given in thousands, those reported in units having been rounded in the Statistical Office, using the digit five (5) in the hundreds place as the criterion for upward adjustment.

Unless otherwise indicated, all estimates relate to the modified present-in-area population within present geographic boundaries. This type of population, and its comparability with the *de jure* estimates, has been discussed in detail on p. 13 and in the 1955 and 1956 *Demographic Yearbooks.* In Table 4, major differences which exist between the population shown and the standard modified *de facto* have been indicated in footnotes. Also, for emphasis and clarity—especially during war years—the disposition of certain major segments of population such as armed forces has been indicated in Table 4, even though this disposition does not constitute disagreement with the standard.

Estimates relate to the mid-point (1 July) of the specified calendar year. In cases where official estimates were available for 31 December only, the arithmetic mean of two consecutive end-of-year estimates was computed and presented in this table as the midyear estimate. In a few cases, official estimates regularly prepared for a date other than 1 July are given in the table, accompanied by a note indicating the date to which they refer.

Census returns have been used when an acceptable estimate for the year in question was not available. For years in which the results of a current enumeration as well as an estimate were available, the census figure has been shown in place of the midyear estimate if the two figures appeared not to be in sufficient agreement. Whenever a census return appears in this table, it is shown in boldface type for easy identification.

For consistency with Table 1, a United Nations estimate has been used for 1960 whenever an official figure was lacking for a non-sovereign area.

Series believed to be of questionable reliability are set in italics rather than in roman type. No attempt was made to evaluate separately each estimate in the series. Rather, the classification of other than current estimates as "reliable" and of "questionable reliability" is based on an assumption that the type-of-estimate code for the latest year refers also to estimates for perhaps the last 5 years; that the code qualifying estimates for 1949-1951, shown in the 1952 *Demographic Yearbook,* applies equally to estimates back to 1945 and that series classed as reliable according to these two codes must also have been relatively reliable in the intervening and earlier years. Thus, these assumptions have the effect of classing the earlier estimates in the series as better than they might have been and overstating reliability between 1941 and 1950. But since the criteria for current reliability is rather stringent, and since there were few cases where the evaluation of 1949-1951 estimates was "poor" while that for 1960 and proximate years was "good", the errors of classification probably tend to be minor. For further details on the method, see page 15.

Coverage: This table, containing data for 221 geographic areas, is one of the most comprehensive published in the *Yearbook.* Major countries are included even if the recent span of years for which estimates are available is short; smaller areas are excluded unless the period of years is relatively extensive.

The policy of Table 4 is to show total population rather than that for sub-national segments.

Limitations: Comparability of population estimates is limited by the factors set forth on p. 13, namely by the variation in the meaning attached to the terms *de jure* and *de facto* in defining the total count, by the accuracy of the census on which estimates are based and by the method of constructing intercensal and post-censal estimates.

Intercensal estimates are usually revised, if required, when the results of a new census become available. However, this is not invariably done, with the result that in a number of cases, a marked break appears in the series between the unrevised pre-censal estimate and the census result. In addition, since many of the results of the 1960/61 censuses are still provisional, the estimates for the preceding intercensal period have not yet been brought into accord with them. In some of these series, the need for revision appears obvious; in others, only minor discontinuities are evident. In either case, it is sometimes difficult to be sure that a real discontinuity exists when the census post-dates the estimate by several months during which substantial migration of population may have occurred or when the census results are themselves still subject to revision. Nonetheless, series which show a marked irregularity of this type are distinguished with a section mark (§) in the stub and a vertical bar (|) at the break in continuity; these symbols together with the use of italic type referred to above, should give an adequate indication of the less-reliable series.

Table 5

Table 5 shows latest available distribution of population classified by age and sex within the period 1957-1961. These data complete and extend the historical time series for 1940-1960 shown in the 1960 *Demographic Yearbook.* Limitation of the time coverage to 1957-1961 excludes only 2 distributions not previously available for publica-

[30] *Op. cit.*

tion, namely, the results of the 1955 census of Greenland and the 1956 census of China (Taiwan).

Data included are the results of population censuses or an intercensal or post-censal estimate constructed by the natural increase method. In the absence of a midyear estimate, a mean of two acceptable end-year estimates has been substituted, and if only one end-year estimate is available, it is shown. The reference date of the census or estimate appears in the stub of the table and the results of censuses are further identified by a (C) following the date. Means, as described above, are not separately identified except in the case where the calculated mean differs from a true mid-year estimate given in Table 4.

The age classification shown is based, unless otherwise indicated, on age at last birthday, and it includes 20 categories as follows: under 1 year, 1-4, 5-9, continuing in 5-year groups to 84, a residual category of 85 and over and unknown. This is in accord with the classification recommended by the United Nations.[31]

Unless otherwise noted, data relate to the modified present-in-area population of geographic areas within present territorial boundaries, as described on p. 14. If the modification has involved large numbers of persons, a special note is also appended for clarity even though the resulting estimate is not inconsistent with the standard for the table.

Estimates believed to be of questionable reliability are set in italics rather than in roman type. Classification into reliable and less reliable is based on the method of their construction as described in connexion with total figures in Table 4; no attempt has been made to take account of age-reporting accuracy, the evaluation of which has been described on page 15.

Coverage: Table 5 includes one age-sex distribution of population for 104 geographic units, of which 39 relate to a census count and 65 to estimates.

Availability was not the sole criterion used in determining the scope of Table 5; a number of estimated age-sex distributions were deliberately excluded on the basis of their construction. To be included in this table, an estimate must have been constructed by the natural-increase method, supplemented by migration statistics if available. Distributions which result when the estimated total population is distributed by age and sex according to percentages in each age-sex group at the time of the census are not acceptable. Such distributions are on file for Bolivia, Brazil, Burma, Ceylon, Chile, Colombia, Ecuador, Honduras, Italy, Mexico, Peru, St. Kitts-Nevis and Anguilla, Singapore, the United Arab Republic and Venezuela.

Limitations: Comparability of population data classified by age and sex is limited in the first place by variations in the definition of total population which has been discussed in detail on p. 13, and by the accuracy of the original enumeration, also discussed above. Both of these factors are more important in relation to certain age groups than to others. For example, underenumeration is known to be more prevalent among young children than at older ages; the composition of the total population is primarily a function of the inclusion or exclusion of certain groups who may be of selected ages, such as members of the armed forces and so forth. Consideration should be given to the implications of these basic limitations in using the data.

Further to these general qualifications are the special problems of comparability which arise in relation to age statistics in particular. Age distributions of population are known to suffer from certain deficiencies which have their origin in underenumeration of infants and in irregularities in age reporting. Although some of the irregularities in the age statistics tend to be obscured or eliminated when data are tabulated in 5-year age groups, precision still continues to be affected, though the degree of distortion is not always readily seen. For a discussion of this factor, see page 14.

Another limitation on comparability is found in the basis for the age classification employed by the various countries. Whenever it was known that the classification was based on year of birth rather than the standard "age at last birthday", the data are so noted in the tables and allowance should be made for this factor in using them. The effect is described on page 14.

Deviations from the standard age classification of the table are shown by bracketing and footnotes. Although precise international comparability of specific age groups is often lacking,[32] the data are nevertheless included because of their basic value for the area concerned. This is particularly true for African areas. Since statistics for Africa have not been generally available until recent years, the results of sample surveys and estimates based on other types of inquiries are included because of the scarcity of information for this continent.

In connexion with the age classification, it should be noted that zero frequency reported in the unknown-age category is not always an indication of perfect age reporting; it is more often an indication that an assumed age has been assigned before tabulation began. The method of age allocation is not always known and hence it is noted infrequently in the tables, but the possibility of its having occurred should not be overlooked.

As noted in connexion with Table 4, intercensal estimates of total population are usually revised, if required, to accord with the results of a census of population. Intercensal age-sex distributions, however, are not always revised in this way. Those which have not been revised are marked provisional in this table; they should be used with extreme caution in analysing time trends though their utility for studying age structure for the specified year is probably unimpaired.

Table 6

This table presents new and revised data on the trend of live births for each year 1952-1961 together with crude birth rates for quinary periods beginning 1945 and ending 1959, and each year 1952-1961. The 5-year averages, which provide a trend, are included for consistency with the trend of mortality in Table 14. The extension of the time coverage to include data which may be available for the current year (1961) is an innovation with this issue of the *Demographic Yearbook.*

Statistics shown are obtained almost entirely from civil

[31] *Principles and Recommendations for National Population Censuses, op. cit.,* para. 503.

[32] There are at least 56 varieties of nonstandard age classes in Table 5.

registers of live birth. However, in a number of cases where civil registration data are known to be non-existent or unreliable, it has been possible to include estimated rates which are thought to reflect more accurately the true level of natality. These official rates for isolated years have been obtained from sample surveys, from analysis of consecutive population census results, and from informed guesses. To distinguish them from civil registration data, they are identified and their nature explained in footnotes where the corresponding recorded rate is also given if possible.

The quality-of-data code appears in the first column of Table 6 in the form C, U or . . . , and its proper interpretation has been explained on p. 16. Wherever precise measures have been made available by the countries, the incompleteness of registration has been further described in terms of percentages, given in footnotes to the codes.

Data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than in roman type. A description of the basis for this quality specification may be found on p. 17.

Coverage: Statistics for a total of 207 geographic units are included in Table 6. Major countries are shown even though figures for recent years are lacking, and data for segments of the population are presented when statistics are not available for the country as a whole. These subnational data are included not as representative statistics but as an index to the areas for which birth statistics are routinely collected.

Rate computation: The annual crude birth rates shown in Table 6 are the number of live births per 1,000 persons in the population, estimated at the mid-point of the year. The 5-year average rates are the aggregate number of live births in each quinquennium per 1,000 aggregate population for the same period. In general, the population totals on which rates are based are the official midyear estimates which are set forth in Table 4.

Every effort was made to achieve strict correspondence between the numerator of the rate (live births) and the denominator (population), and notes are used to describe instances where correspondence could not be obtained.

Limitations: The limitations imposed by the quality code, and the classification of data as reliable or unreliable derived from it, have been described elsewhere. In using data from this table, care must be taken to consider also the effects of tabulation by date of registration rather than by date of occurrence. Countries which are known to have adopted the registration basis of tabulation are identified in the table with a dagger (†), which has been placed in the same column as the quality code for convenience in evaluating the combined effect.

It should be emphasized that whenever the lag between occurrence and registration is prolonged, i.e., where a large proportion of live-birth registrations are delayed—as in some parts of Latin America, Asia and Africa—live-birth statistics by date of registration may give a very distorted or even wholly erroneous picture of natality trends. They may often produce birth rates of credible magnitude even though births known to have occurred admittedly fail to get registered. In such cases, incompleteness of current registration is masked by the inclusion of events which occurred in previous years, and the resulting data may be very misleading, especially in so far as fertility characteristics are concerned.

The countries in which live-birth statistics are defined to exclude infants born alive who died before registration of their birth, or before having survived 24 hours, are noted in the tables. The effect on birth statistics is one of understatement, the general magnitude of which has been discussed in the *Handbook of Vital Statistics Methods;*[33] the effect on rates for Guadeloupe and Martinique is given in a footnote to the table.

Irrespective of their limitations, crude birth rates do provide a measure of gross additions to the population. They can also give a general idea of trends over time within one area and information which allows the rough classification of countries according to levels of natality. But because of the variation between countries in the age and sex composition of the population, crude rates do not precisely reflect differences in fertility and they cannot, therefore, be used alone to evaluate current trends and future prospects.

Table 7

Live births by age of mother are given in Table 7. The age classification begins with an under-15-year category and continues through quinquennial groups to 49, 50 and over and unknown. Age in this as in other tables showing this characteristic is defined as age at last birthday or completed years.

Data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than in roman type. A description of the basis of this quality specification may be found on p. 16.

Coverage: The latest available distribution—either new or revised—is included in the table for each of the 111 geographic areas reporting 50 or more births, even though the year to which data relate is not a current one. Thus, the table may serve as an index to those geographic areas which tabulate live births by age of mother and, in addition, it may give some indication of the timeliness of the statistics.

Limitations: Comparability is affected by differences in the basis of tabulation, i.e., date of occurrence or date of registration. The dagger (†) in the stub indicates the countries which tabulate by date of registration, the implications of which have been set forth on p. 17.

Because these are statistics classified according to age, they are subject to the limitations with respect to accuracy of reported ages similar to those already discussed in connexion with population by age and sex. The absence of frequencies in the unknown age group does not necessarily indicate completely accurate reporting and tabulation of the age item. It is often an indication that the unknowns have been eliminated by assigning ages before tabulation, or by proportionate distribution after tabulation. On the other hand, large frequencies in the unknown-age category may indicate that a large proportion of the births are illegitimate, the records for which tend to be incomplete in so far as characteristics of the parents are concerned.

[33] *Op. cit.*, Chapter IV.

One other factor must also be kept in mind in using these data. This is the variation which may result from calculating age of mother at birth of child (or at time of registration) from year of birth alone rather than from day, month and year of birth. Information on this factor is given in footnotes when known.

Lack of strict comparability, both among data for different countries shown in this table, and between those shown here and in Table 6, is due to a variety of causes. In certain instances, data by age refer to deliveries or confinements rather than to live births; moreover, in some cases the confinements referred to are those resulting in live birth only and in others to those resulting in live-born and stillborn offspring. Some countries restrict tabulations by age of mother to legitimate births only, while live births in Table 6 relate to a total of legitimate and illegitimate. In most cases, this limitation qualifies the data very little, but where illegitimate births are relatively numerous, data limited to legitimate births cannot be considered representative. Similarly, for a few countries, the distribution of live births by age of mother is confined to infants born alive who did *not* die before registration of birth, whereas the totals in Table 6 include those who died before registration.

When birth statistics refer to registrations rather than occurrences, the age of the mother will almost always refer to the date of registration rather than to the date of birth of the child. Hence, in those countries where registration of births is delayed, often for years, it is evident that the distribution by mother's age will be of limited use as an index of present natality patterns.

Table 8

Table 8 presents new and revised data on the trend of late foetal deaths for each year 1952-1960, together with average foetal death ratios for quinary periods, 1945-1959, and for each year 1952-1960. The data shown are obtained from civil registers of foetal death.

A late foetal death is defined for purposes of this table as one which occurred after at least 28 completed weeks of gestation but prior to complete expulsion from the mother. When it was known that data in Table 8 did not conform to this definition, footnotes have been appended. Full and precise information on current national definitions is not available for all areas and all years, but reference should be made to the *Handbook of Vital Statistics Methods*[34] for additional details.

In accordance with the usual practice, the quality code (C, U and ...) is presented in the first column of the table and, in addition, data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than roman type. A description of the basis for this quality specification may be found on page 16.

Coverage: A total of 139 geographic areas were able to be included in Table 8. Major countries are shown even though figures for recent years are lacking, and data for segments of the population are presented when statistics are not available for the country as a whole. These subnational data are included not as representative statistics but as an index to the areas for which late foetal-death statistics are routinely collected.

[34] *Op. cit.,* Chapter IV and Annex 3.

Ratio computation: Annual ratios shown in Table 8 are the number of late foetal deaths reported per 1,000 live births in the same period. The 5-year average ratios are the aggregate number of late foetal deaths in each quinquennium per 1,000 live births in the same period. Live births, rather than the sum of live births and late foetal deaths, were selected as the base for the ratios in accordance with international recommendations.[35]

All ratios were computed in the Statistical Office of the United Nations on live births shown in Table 6, with the exception of official ratios in the "Proclaimed Area" of Ceylon, for which corresponding live births were not available, and selected years for Ghana where neither element of the ratio has been supplied.

Limitations: Foetal deaths are known to be incompletely registered in most countries of the world, so data for most countries are shown in italics. However, it must be pointed out that when foetal deaths and live births are both underregistered, the resulting ratios may be of quite reasonable magnitude. As a matter of fact, for the countries where live-birth registration is poorest, the foetal-death ratios may be the largest, effectively masking the incompleteness of the base data. For this reason, possible variations in birth-registration completeness—as well as the reported completeness of late foetal deaths—must always be borne in mind in evaluating foetal-death ratios.

In addition to the indirect effect of live-birth underregistration, foetal-death ratios may be seriously affected by date-of-registration tabulation of live births. When the annual number of live births registered and reported fluctuates over a wide range due to changes in legislation or to special needs for proof of birth on the part of large segments of the population, then the foetal-death ratios will fluctuate also, but inversely. Because of these effects, data for countries known to tabulate live births by date of registration should be used with caution unless it is also known that statistics by date of registration approximate those by date of occurrence.

Finally, it may be noted that the counting as stillbirths of live-born infants who die before registration has the effect of inflating the foetal-death ratios unduly because it decreases the birth denominator and increases the foetal-death numerator. This factor should not be overlooked in using data from this table. The potential size of the problem has been set forth in the *Handbook of Vital Statistics Methods,* p. 58.[36]

Table 9

This table, showing late foetal deaths by sex, and illegitimacy percentages, appears for the first time in the *Demographic Yearbook.* It is similar to the corresponding table of live births (Table 10) in the 1959 *Demographic Yearbook,* but it includes only the percentages of late foetal deaths reported as illegitimate; illegitimacy rates are not included.

A late foetal death is defined as one which occurred after at least 28 completed weeks of gestation but prior to complete expulsion from the mother. When it was known that data in Table 9 did not conform to this definition, footnotes have been appended.

[35] *Ibid.,* p. 193.
[36] *Op. cit.,* p. 58.

"Illegitimacy" refers to legal illegitimacy recorded on the foetal death record, that is, it is a characteristic of a foetus "born out of legal wedlock", as determined by the laws of each country. Therefore, illegitimate foetal deaths (unless otherwise noted) are assumed to include foetal deaths to persons in consensual unions or in unions celebrated in a manner other than the legally prescribed one as, for example, by a religious ceremony instead of the prescribed civil contract. Within this context, they include all extra-nuptial foetal deaths. For statistical purposes, foetal deaths for which legitimacy was not stated are assumed to be illegitimate.

Late foetal deaths of unknown sex are included in both sexes but not shown separately.

Data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than in roman type. A description of the basis for this quality specification may be found on p. 16.

Coverage: Late foetal deaths by sex are presented in Table 9 for 113 countries and territories. Of these, 62 show the number and per cent recorded as illegitimate. Major countries are included irrespective of the time coverage, and data for sub-national population groups are presented when representative national figures are lacking.

Ratio computation: Percentages are the number of illegitimate late foetal deaths per 100 late foetal deaths of both sexes reported in the same year.

Limitations: Statistics of late foetal death are subject to all the usual limitations of vital statistics in general and foetal death statistics in particular, as set forth on pp. 16 and 19.

Fundamental or accidental difference between countries in the legal basis for illegitimacy is perhaps the most important factor affecting comparability of illegitimacy statistics. In most countries, illegitimate births or foetal deaths are only those born to unmarried mothers; issue born of a married woman and a person other than her husband are considered issue of the legal union and hence legitimate. In only very few cases are such issue reported as illegitimate.

There is also a difference between countries in the reference date for definition of illegitimacy. In some countries, the law refers to the marital status of the parents at the time the foetus was conceived; in others, their status at the time of the delivery determines legitimacy; in still others, the effective status is that at the time the product of conception is registered. Marriage of the parents subsequent to conception and prior to delivery legitimates issue in many countries, but not in all.

Comparability of illegitimacy statistics is also affected by national attitudes toward illegitimacy. Decision to conceal illegitimacy or to misstate it on the record is conditioned by attitudes in the society in which the mother lives, and also by her economic ability to escape from the community prior to delivery.

The type of union which establishes legitimacy also differs from country to country. In most countries, a religious marriage is not considered legal unless it is accompanied by a civil ceremony. Hence, issue of persons who have not complied with the civil requirements would be considered illegitimate by law, even though the marriage was accepted socially.

The same problem exists in countries where social custom accepts consensual unions. Where such unions are numerous in relation to legal marriages (either because of social or tribal custom or other reasons), the proportion of "illegitimate" issue will also be high in relation to total issue.

Despite the problems connected with characterizing foetal deaths as "illegitimate" issue, the percentages are useful for observing whether illegitimate foetal deaths are responsible for increases in the incidence or whether the ratio of illegitimate to total foetal death has remained stable. Such information may assist in defining the problem.

Table 10

Foetal deaths and ratios classified by gestational age are set forth in Table 10 for each year 1952-1960. These data were introduced in the 1957 *Demographic Yearbook* in connexion with mortality and continued in the 1959 issue in connexion with natality. Together with these previous presentations, Table 10 provides a series for the period 1949-1960.

Gestational age (period of gestation) is defined (unless otherwise indicated), in accordance with the international recommendation,[37] as *the number of completed weeks which have elapsed between the first day of the last menstrual period and the date of delivery of the foetus.* Periods reported in months—either calendar or lunar—have been converted to gestational intervals in weeks, according to the following scale:

1 – 4 months = under 20 weeks
5 months = 20 – 23 weeks
6 months = 24 – 27 weeks
7 months = 28 – 31 weeks
8 months = 32 – 35 weeks
9 months = 36 – 39 weeks
10 months = 40 weeks and over

Foetal deaths have been classified into 8 categories of gestational age, namely under 20 weeks, 20-27 weeks, 28-31 weeks, 32-35 weeks, 36 weeks, 37-39 weeks, 40 weeks and over and unknown. This is in accord with, but more detailed than, the classification recommended by the United Nations.[38] National variations are shown by means of consolidation bars and footnotes; three dots (. . .) in lower age groups indicate that intermediate or late foetal deaths rather than those of all ages are included in the tabulation.

Data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than in roman type. A description of the basis for this quality specification may be found on p. 16.

Coverage: Series for 32 countries and territories are included in Table 10; these comprise all data currently available.

Ratio computation: Ratios are the number of foetal deaths which occurred in each gestational age group per 1,000 total live births which occurred during the same year.

[37] *Principles for a Vital Statistics System, op. cit., Principle* 309 (c) (23).
[38] *Ibid., Principle* 410 (e) (18).

The live-birth base was adopted rather than the combined live birth and foetal death, because it is assumed to be more stable in time and more comparable from country to country; for further discussion of this point see p. 19.

It should be noted that, although the use of live births as a ratio base at each gestational age should provide a set of ratios which together would produce the total foetal-death ratio, this is not always the case because of the relatively large number of foetal deaths with gestational age unstated. Although methods of allocating unstated age are available, none has been used in Table 10.

Limitations: Foetal-death statistics are probably the least accurate of all vital statistics; their general deficiencies have been reviewed on p. 19, and the special limitations of late foetal deaths are set forth on p. 28.

The principal factor limiting comparability of the statistics is the variation observed in the content of the data. For a few areas, the data purport to be "all foetal deaths, irrespective of gestational age"; for many others, however, they are "late foetal deaths", i.e., those of 28 or more weeks of gestation; for others, they are intermediate and late foetal deaths, i.e., those of 20 or more weeks' gestation; for still others, they are foetal deaths of at least 3 months' gestation. In view of these differences in content and the basic deficiencies in registration completeness, it must be emphasized that no real basis exists for comparing ratios from various countries. At this stage of development, the principal justification for including these statistics by gestational age is that they can assist in defining more clearly the content of other foetal death tables; they can show the lack of reporting at young gestational ages; and they can give, for some countries, an indication of the relative distribution of foetal deaths according to gestational age.

Table 11

This table, which is appearing for the first time in the *Demographic Yearbook,* presents the trend of perinatal deaths and ratios for the period 1952-1960.[39]

Perinatal mortality rates are designed to measure the risk of dying during the period near parturition, that is, immediately before, during and soon after birth. This use is predicated on the premise that the factors influencing neonatal mortality are more closely related to those influencing prenatal than they are to those effective in postneonatal infant mortality. A composite measure is also justified on the well-founded assumption that some deaths during the first few days of life are inadvertently, or in some cases deliberately, registered and counted as a foetal death rather than as a live birth and a neonatal death, and that a combination of the frequencies in these two categories would, therefore, be free of the limitations of under- or over-statement assumed to be inherent in the two categories used separately.

"Perinatal", for purposes of this table, is defined as the *period of prenatal existence after viability is reached, the duration of labour, and the early part of extra-uterine life.*[40] For computation purposes, the lower limit of viability is taken as 28 completed weeks of gestation; thus late foetal deaths, as set forth in Table 8, comprise one component of the measure. The other component, i.e., "early part of extra-uterine life" is taken to be mortality during the first six days of life, also known as early neonatal, or semanatal, mortality; these frequencies may be found in Table 15.

In accordance with usual practice, a quality code (C, U and ...) derived from Tables 8 and 15, is presented in the first column of the table and, in addition, data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than in roman type. A description of the basis for this quality specification may be found on p. 16.

Coverage: Data for 96 countries and territories are included in Table 11; this coverage is essentially the lowest common denominator from Tables 8 and 15. Major countries are shown even though figures for recent years are lacking, and data for non-representative segments of population are presented when statistics are not available for the country as a whole.

Ratio computation: Ratios are the number of perinatal deaths reported each year per 1,000 live births for the same year. These ratios, therefore, will be the sum of the late foetal death ratios shown in Table 8 and the under-7-day death rates shown in Table 13.

Limitations: Except for the deficiencies due to imperfect registration of deaths of live-born infants who die during the first few days of life which, by definition, are eliminated, all the limitations of foetal death statistics, infant death statistics and live birth statistics, as described on pp. 28, 31 and 27 must still be borne in mind in evaluating international comparability of perinatal statistics.[41]

The varying degrees of completeness with which foetal deaths are registered in different countries are perhaps the most important limitation on international comparability. Coupled with this are the differences in the national statistics of late foetal death as regards the minimum gestational age. The late foetal death component may refer to those over 28 weeks of age, over 20 weeks of age, or even to all foetal deaths irrespective of age. When this limit is known, it is noted in the table, but it must be emphasized that the dimensions of the late foetal death definition are not clear in all cases and distributions by gestational age, which could be used to verify the limits, are not yet available for all areas.

Another source of variation related to the above is the difference observed in the upper limit of the second component, that is, in the infant deaths included. In principle, deaths during the first week are supposed to be included, but in many cases, the classification of infant deaths by detailed age does not provide semanatal mortality but rather mortality under 10 or 14 days of age.

The completeness with which live births are registered

[39] A brief analysis of trends in perinatal mortality was presented in the 1957 *Demographic Yearbook,* p. 8; data for 1950-1955, analysed by cause, are available in World Health Organization *Epidemiological and Vital Statistics Report,* Vol. 10, No. 11-12, 1957.

[40] This is the definition agreed upon by the Study Group on Perinatal Mortality set up by the World Health Organization Regional Office for Europe, at its first meeting in Brussels, 17-23 September 1953 (Document MH/EUR/74.54, Geneva, 1954. 84 pp., mimeo).

[41] A more detailed treatment may be found in *Foetal, Infant and Early Childhood Mortality,* 2 vols. Document ST/SOA/Ser.A/13/Add.1. (United Nations publication, Sales No. 1954.IV.8)

is also indirectly effective as a limitation on comparability of perinatal mortality rates in that unreliable birth figures used as the denominator of the perinatal ratios will artificially inflate them. Likewise, live births tabulated by date of registration rather than by date of occurrence can have an adverse effect on the ratios. Moreover, the exclusion from live birth statistics of those live-born infants who die shortly after birth and are, therefore, registered as stillbirths, can have the effect of artificially increasing the perinatal ratios since the denominator will not correspond to the numerator.

Table 12

This table presents new and revised data on the trend of deaths under one year of age for each year 1952-1961, together with average infant mortality rates for quinary periods, 1945-1959, and for each year 1952-1961. The extension of the time coverage to include data which may be available for the current year (1961) is an innovation with this issue of the *Demographic Yearbook.*

Infant death statistics shown are generally obtained from civil registers of death. However, in a number of cases where civil registration data are known to be nonexistent or unreliable, it has been possible to include estimated rates which are thought to reflect more accurately the true level of infant mortality. These official rates for isolated years have usually been obtained from sample surveys or from informed guesses. To distinguish them from civil registration data, they are identified and their nature explained in footnotes where the corresponding recorded rate is also given, if possible.

In accordance with the usual practice, the quality code (C, U and ...) is presented in the first column of the table and, in addition, data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than roman type. A description of the basis for this quality specification may be found on p. 16.

Coverage: Data in this table relate to the present-in-area population of the 190 geographic units for which recent statistics on infant deaths were reported. Some of these areas are represented by data for sub-national population groups; these are not nationally significant, but they are included in order to provide an index to the availability of infant-mortality statistics throughout the world.

Rate computation: Computed in accordance with the conventional method, the annual infant-mortality rates shown here are the number of deaths under 1 year of age per 1,000 live births which occurred during the same time period. The 5-year average rates are the aggregate number of infant deaths in each quinquennium per 1,000 live births in the same period. This means that no adjustment was made to take account of the fact that some of the infant deaths which occur during a given year are deaths of infants who were born during the preceding year. However, unless the numbers of live births or infant deaths are changing rapidly, the error involved is not important.[42]

Limitations: Perhaps the most important and widespread limitation on the comparability of infant-mortality rates is that resulting from compiling statistics of infant deaths and live births by date of registration rather than date of occurrence of the events. Where these procedures obtain, a large increase, for whatever reason, in the number of live births registered in any one year may introduce sizeable errors into the infant-mortality rates, especially since deaths tend to be more promptly reported than births.

If the delay in registration remains nearly constant and is approximately the same for births and deaths, the rates are not affected to any appreciable degree. But if—as is the case in many countries—a large proportion of the births are not registered until many years after occurrence, then infant-mortality rates obtained by relating infant deaths for any one year to births which occurred over a period of years, have little validity. Because of the importance of this factor, especially as it relates to the live births which constitute the denominator of the infant-mortality rates, the statistics known to be by year of registration are identified with a dagger (†).

Even on a date-of-occurrence basis, underregistration of births and infant deaths also affects the infant-mortality rates unless the proportion registered is the same for both components. The code C or U, discussed in detail on p. 16, will serve as a guide in this connexion.

This code refers to the completeness with which deaths under one year are registered and reported. As noted above, differences in levels of completeness between the two components of the infant-mortality rate, i.e., the infant deaths and the live births, will bias the rates upward or downward, the direction of bias depending on which component is more fully registered. This factor is not reflected in the choice of type which distinguishes reliable from unreliable data; in each instance, rates are shown in the same type as the corresponding frequencies.

Another factor which has a bearing on the completeness of live-birth and infant-death registration is that concerned with the statistical definitions of the events to be reported. The exclusion from both the live-birth and the death register of live-born infants who die before 24 hours of age or before registration of birth, may distort the statistics to some extent, tending to give the rates a downward bias. Failure to register as a live birth each infant death which occurs during the first few weeks of life may also be a factor in the lack of comparability among infant-mortality rates, but the effect, if any, would be toward an upward bias.

Table 13

Annual rates of infant mortality by detailed age for each sex separately and both sexes combined are presented in Table 13. This table has been based on data from Table 15 but it covers the period 1952-1960. It last appeared in the 1957 *Demographic Yearbook,* where rates for the period 1948-1956 were set forth; previous to that, rates for 1936-1949 were shown in the 1951 *Demographic Yearbook,* producing, with Table 13, a 25-year series.

This table of infant-mortality rates by detailed infant age can be considered as an extension of rates for the entire age span, set forth in Table 16. The importance of these data for analysis of mortality has been set forth in the text to the corresponding frequency table, No. 15.

[42] For a more detailed discussion of this problem, see "The Measurement of Infant Mortality" by W. P. D. Logan, *Population Bulletin of the United Nations.* Department of Social Affairs, Population Division. Document ST/SOA/Ser.N/3, October 1953, pp. 30-67. (Sales No. 53.VIII.8)

The age classification used in Table 13 is a slight expansion of that employed in the base Table 15. Subdivisions by age in this table are 5, namely, under 1 day, 1-6 days, 7-27 days, 28 days-5 months, and 6-11 months. Unknown age is included only in the rate for age under 1 year.

Unlike the classification in Table 15, this one subdivides the mortality from 28 days to 11 months into two groups. The omission of the corresponding frequencies in Table 15 is due to lack of space, but these can readily be approximated, using the rates and the corresponding live births from Table 6. It will be noted also that this classification is given in terms of days rather than in calendar months, as was the corresponding table in the 1957 *Demographic Yearbook*. This is in accord with international recommendations for infant mortality statistics,[43] but it will be noticed that many countries still do not adhere to this standard and continue to tabulate early infant mortality in calendar month periods.

Age, in this table as in all others, is defined as days and months of life completed, based on the difference between the day, month and year of birth and the day, month and year of death. Hence, the age group 5-11 months includes infants from 5 to under 12 months.

Deaths of unstated sex are included in the rates for both sexes in this table and hence this rate, shown in the first column of the table, should agree with the conventional infant mortality rate shown in Table 12. Discrepancies of any magnitude are indicated in footnotes.

Coverage: Rates are available for 115 geographic areas. The criterion for rate computation was a total frequency of infant deaths, for both sexes combined, of 50 or more. National and sub-national figures are included when this criterion was met.

Rate computation: Rates are the number of infant deaths of the specified age and sex which occurred in the year, per 1,000 live births of the same sex during the same period. Thus the base of each age-sex rate is the same as that of the rate for all ages of the same sex, and no adjustment was made to take account of the fact that some of the deaths were those of infants born not in the current year but in the preceding one. Live births used in the denominator of the rates for both sexes are those presented in Table 6.

Limitations: Although infant mortality rates by detailed age are of course subject to all the limitations noted in connexion with vital statistics (see p. 16), perhaps the most important is that which results from tabulation of live births by date of registration rather than date of occurrence. The implications of this procedure have been set forth in connexion with Tables 6 and 12 above, to which reference should be made.

Underregistration of births and deaths, as indicated in the quality codes appended to Tables 6 and 12, also introduces non-comparability, the direction of the bias depending on which component is more completely registered.

Variations in the statistical definition of a live birth and a stillbirth have been discussed on p. 19. It may be noted that data for Guadeloupe and Martinique could be used to evaluate the effect of this factor.

The method of reckoning infant age at death to the nearest day, disregarding hours, versus the method of reckoning time elapsed between date of birth and date of death in minutes, hours, and days as appropriate, introduces a source of non-comparability. This factor is particularly troublesome in determining the number of deaths under 1 day and those classified in the next age interval; care should be taken to consider this in analysing rates—especially in these age groups.

Failure to tabulate infant deaths under 4 weeks of age in terms of completed days introduces another source of variation between countries. Deaths described as occurring "under one month" usually connote deaths within any one calendar month; rates based on these frequencies are not strictly comparable with those referring to deaths within 4 weeks or 27 completed days. Many other differences in age classification will be evident from the table, including 5, 10 or 14 days rather than 7 days for the upper limit of the semanatal mortality period, and 6 rather than 5 completed months for the division between intermediate and late infant mortality. The effect of these differences is difficult to determine but they should be borne in mind in using the rates.

Table 14

This table presents new and revised data on the trend of deaths for each year 1952-1961, together with average crude death rates for quinary periods, 1945-59, and for each year 1952-1961. The extension of the time coverage to include data which may be available for the current year (1961) is an innovation with this issue of the *Demographic Yearbook*.

Data shown are obtained almost entirely from civil registers of death. However, in a number of cases where civil-registration data are known to be non-existent, or unreliable, it has been possible to include estimated rates which are thought to reflect more accurately the true levels of mortality. These official rates for isolated years have been obtained from sample surveys, from analysis of consecutive census results and from informed guesses. To distinguish them from registered data, they are identified and their nature explained in footnotes where the corresponding recorded rate is also given if possible.

In accordance with the usual practice, the quality code (C, U and ...) is presented in the first column of the table and its proper interpretation has been explained on p. 16. Wherever precise measures have been made available by the countries, the incompleteness of registration has been further described in terms of percentages given in footnotes to the codes.

Data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than roman type. A description of the basis for this quality specification may be found on p. 16.

Coverage: Deaths and death rates are shown for 210 geographic units. Major areas, even though lacking recent data, are included; data for segments of population, e.g., non-indigenous population and population living in a major city, are included when statistics for the country

[43] Regulation No. 1 of the World Health Organization, Article 8; United Nations *Principles for a Vital Statistics System, op. cit., Principle* 410 (e) (15).

as a whole are not available. Such data are of only minor significance, but they do serve to indicate the areas for which death statistics are obtainable.

Rate computation: Crude annual rates shown in this table are the number of deaths reported for a calendar year per 1,000 persons present in the same geographic area at the mid-point of the year. The 5-year average rates are the aggregate number of deaths in each quinquennium per 1,000 aggregate population for the same period. In general, the population totals on which rates are computed are those presented in Table 4.

Every effort was made to achieve strict correspondence between the numerator of the rate (deaths) and the denominator (population), and notes are used to describe instances where correspondence could not be obtained.

Limitations: The limitations imposed by the quality code, and the classification of data as reliable or unreliable derived from it, have been described elsewhere. Although the factor is of greatest importance in connexion with live births, attention is directed to the variation among countries in the basis of tabulation, i.e., by date of occurrence or date of registration. The symbol (†) identifies those areas which tabulate according to the registration date. The implications of this practice are described on p. 17.

The possibility of error being introduced by exclusion of deaths of infants who died before registration of birth should not be overlooked. The effect of this procedure may be judged from data for Guadeloupe and Martinique.

In addition to these minor sources of variation, it must be emphasized that because they take no cognizance of differences in the age-sex composition of populations, and since mortality is highest at the older and younger ages, crude death rates are not strictly comparable from area to area or for the same area over time, and care should be exercised in using them for this purpose.

Table 15

Distributions of deaths by age for each sex, each year 1955-1960, are set forth in Table 15. These data combined with the series for 1948-1956 shown in the 1957 *Demographic Yearbook,* and those for 1936-1947 in the 1951 *Demographic Yearbook,* provide a 25-year series of mortality by age and sex for a number of countries.

An innovation this year is the classification of age employed. Infant deaths by detailed age were customarily shown only in the issue of the *Demographic Yearbook* which featured mortality and then in a table separate from the general age/sex mortality table. Beginning in this issue the detailed age distribution of infant deaths (in days) has been incorporated into the general table or, in other words, the under-one-year category has been expanded to 4 categories of infant age, i.e., under 1 day, 1-6 days, 7-27 days and 28-364 days; infant deaths of unknown age are included only in the sub-total of under 1 year, although there is some reason to believe they are predominantly deaths under 1 day of age. The remainder of the classification consists of a 1 to 4-year group, 5-year groups ending with 80-84, a residual group of 85 and over and unknown. Both parts of this classification are in accord with international recommendations.[44] The infant age classification, which uses the lunar-month class of 28 days, was recommended by the World Health Organization in defining infant deaths for purposes of cause-of-death classification and for special statistics of infant mortality.[45]

Age, unless otherwise noted, is assumed to be expressed in completed units of time, that is, the age of the infant at death has been reckoned in completed minutes, hours or days elapsed since birth, and the age of persons dying after 1 year has been calculated by subtracting day, month and year of birth from day, month and year of death.

Data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than in roman type. A description of the basis for this quality specification may be found on p. 16.

Coverage: Data are shown for 158 areas. Every area is included irrespective of the number of deaths involved, as well as data for sub-national segments (geographic or ethnic). Thus, the table may serve to indicate the countries which tabulate deaths by age and sex and those which follow the United Nations' recommended age classification.

Limitations: Data in this table are subject to the limitations implied by the code of completeness, which was described in connexion with vital statistics in general (p. 16) and which appears in Table 14. Comparability may also be affected to some degree by differences in the basis of tabulation, i.e., by date of occurrence or by date of registration. The symbol of a dagger (†) is used to indicate countries which tabulate by date of registration.

The exclusion from some series of deaths of infants who died before their births were registered and who were thereby counted only as stillbirths or as "infants presented without life" may contribute to the lack of comparability, among total deaths, deaths under one year, deaths under 1 week and under 1 day. When this registration factor is known to exist, the qualification is set forth in a footnote to the table. The importance of the effect can be judged from data for Guadeloupe and Martinique, set forth in Tables 12 and 14.

Because these data are classified according to age, they are subject to the inaccuracies of age reporting described in connexion with population (see p. 14). The factors influencing inaccurate reporting may be somewhat dissimilar in vital statistics (because of the differences in the method of taking a census and registering a death) but, in general, the same errors can be observed.

As in census tabulations, the absence of frequencies in the unknown age group does not necessarily indicate complete age reporting; it may also be an indication that the unknowns have been eliminated, either by assigning an age before tabulation or by proportionate distribution after tabulation.

A special limitation on comparability of neonatal mortality is the variations in the classification of infant age used. It is evident from the footnotes in the tables that many countries continue to classify infant age in calendar, rather than lunar month (4-week or 28-day) periods.

[44] *Principles for a Vital Statistics System, op. cit., Principle* 410 (e) (9) and (15).

[45] World Health Organization. Regulations No. 1, Article 8.

The effect of this is not evident from data in Table 15, but some idea may be obtained from data in Table 12 of the 1957 *Demographic Yearbook* where infant deaths for Austria, Finland and Norway have been published in calendar month as well as lunar month units.

Variation in the method of reckoning age at the time of death also introduces limitations on comparability. Although it is to some degree a limiting factor throughout the age span, it is an especially important consideration with respect to deaths at ages under one day and even up to one week (semanatal deaths). As noted above, the standard method of reckoning infant age at death is to calculate duration of life in minutes, hours and days, as appropriate. The age is then in completed units of time. In some countries, however, infant age is calculated in units of days only, that is, age at death for an infant is the difference between the day, month and year of birth and the day, month and year of death. The result of this procedure is to classify as deaths at age one day many deaths of infants dying before they have completed 24 hours. The under-one-day class is thus understated while the frequency in the one-day-of-age group is inflated.

Differences in methods of calculating or reporting age at death persist throughout the age span, with some countries following the recommended procedure of expressing age in completed years of age, that is, in calculating age by subtracting day, month and year of birth from day, month and year of death, while others use only the year of birth and death. This has the effect of overstating each age group at the expense of the one immediately preceding it, but except for the initial and terminal groups, the effect is probably cancelled out.

Table 16

Death rates specific for age and sex are presented in Table 16. In general, rates are for the period beginning 1952 to provide continuity with the previous trends of age-sex specific death rates published in the 1951 and 1957 *Demographic Yearbooks.*

The age classification used is the same as that used in previous issues of this table, namely, an initial age class of under 1 year followed by 1-4 and 5-year age groups to 80-84; a residual terminal group of 85 years and over completes the classification. Deviations from these categories are shown in the table by consolidation bars. It should be emphasized that this classification does not correspond in every detail to that in Table 15, because infant mortality rates by detailed age are shown in a separate table, Table 13; Table 16, therefore, is limited to the regular age classification which shows under-one-year deaths as a group.

Since this rate table is based on frequencies from Table 15, the definition of age is in terms of completed years, that is, the difference between day, month and year of birth and day, month and year of death.

Data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than in roman type. A description of the basis for this quality specification may be found on p. 16.

Coverage: A total of 90 are able to be included in this table despite the fact that an acceptable population base corresponding to the age and sex classification of the deaths was required. "Acceptability" in this case implies corresponding geographic and population-group coverage and the same age classification. Further, the estimate must be the result of an enumeration or be based on an enumeration adjusted in time by the use of vital and migration statistics. Distributions estimated by the pro-rating method of applying to the total the percentages of population in each age group at the time of the census are not used for computation of rates.

Rate computation: Each rate is the number of deaths that occurred within a given age-sex group during the course of a year, per 1,000 persons falling within that age-sex group at the middle of the year or at some other date within the year. The populations used are those which appear in Table 5 or in the corresponding table of the 1960 *Demographic Yearbook* where the trend of population by age and sex is given. Deaths at unknown age and the population of unknown age were disregarded except as they formed part of the death rate for all ages combined.

It should be noted that the rates for infants under 1 year of age in this table differ from the infant mortality rates shown in Tables 12, 13 and 19, because the latter are computed in relation to live births rather than per 1,000 population.

Also, the rates shown here for all ages combined differ in a number of cases from those shown elsewhere, the reason being that these are based on the population for which an appropriate age distribution was available, while the rates elsewhere may utilize a different total figure. The population by age and sex might refer to a census date within the year rather than to the mid-point, or it might be more or less inclusive as regards ethnic groups, armed forces, and so forth. In a few instances, the difference is attributable to the fact that the rates in this table were computed on the mean population (obtained by averaging age data for two successive Decembers), whereas the corresponding rates in Table 14 were computed on an estimate for 1 July. Differences of these types are insignificant but, for convenience, they are noted in the table.

Limitations: This rate table is based on the absolute frequencies from Table 15 and is therefore subject to all the limitations mentioned in connexion with that table.

The problem of obtaining precise correspondence between deaths and population, as regards the inclusion or exclusion of armed forces, refugees, displaced persons, and other special groups, is particularly difficult where age-specific death rates are concerned. In cases where it was not possible to achieve strict correspondence, the differences in coverage are noted. Male rates in the age range 20 to 40 years are especially affected by this non-correspondence and care should be exercised in using these rates for comparative purposes.

It should be added that even when deaths and population do correspond, the comparability of the rates may be affected by abnormal conditions such as absence from the area of large numbers of young men in the military forces. Death rates may appear high in the younger ages, simply because a large section of the able-bodied members of the age-group, whose death rates under normal conditions might be less than the average for persons of their age, is not included.

Table 17

Table 17 presents deaths and death rates by cause for each year 1955-1960, together with an indication of the extent to which deaths in each cause group were medically certified. This table combines data previously shown in two separate tables; in combination with data from Table 14 of the 1957 *Demographic Yearbook* and those from the 1951 and 1952 *Demographic Yearbooks,* a series beginning 1947 may be constructed, provided adjustments are made for changes in the classification scheme used.[46]

Cause of death is defined as the *morbid condition or disease process, abnormality, injury or poisoning leading directly, or indirectly, to death.*[47] Both the immediate and the underlying causes are reported on the medical certificate of death, but the *underlying cause* is the one to be adopted for tabulation of mortality statistics. It is defined as (a) *the disease or injury which initiated the train of morbid events leading directly to death, or* (b) *the circumstances of the accident or violence which produced the fatal injury.*[48]

The classification of cause of death used is the Abbreviated List of 50 Causes for Tabulation of Mortality of the 1948 (sixth) revision of the International List of Causes of Death.[49] Data tabulated according to previous revisions of the list are not included; those classified according to the 1955 revision are noted.

It will be noted that the full title of each of the 50 cause groups, and the detailed list numbers included, appears in English only at the beginning of the table on p. 398 and in French only at the end of the table on p. 471. This abbreviation of the normal stub entries was adopted because space limitations would otherwise have resulted in a serious curtailment of the time series able to be shown.

Medically certified deaths are those which are reported to have been recorded or certified by a medical attendant. Causes for which type of certification is unknown are assumed not to have been certified by a medical man but by a lay person; hence, they are excluded here.

Percentages of deaths medically certified are shown in all cases where these ratios are less than 100 per cent. When all causes are reported to have been medically certified, a special footnote is used.

Data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than in roman type. A description of the basis for this quality specification may be found on p. 16.

Coverage: A total of 118 geographic areas appear in this table. The criterion used to determine whether or not data for an area should be included was availability of statistics classified according to the Abbreviated List mentioned above. Even though some statistics by cause were known to be inaccurate as shown by lack of medical certification, they were retained in the table unless they were eliminated on the basis of the above criterion. This was done because of the inability to know where to draw a line between "accurate" and "inaccurate" and because even a cause distribution based on poor diagnoses yields some information as to relative importance of one cause and another within the same distribution. It should be noted, however, that rates have been computed only on a selected number of these distributions (see Rate computation below).

Rate computation: Mortality rates by cause are the number of deaths in each cause group per 100,000 persons in the midyear or other annual estimate of population. The rate for all causes combined is, therefore, the sum of the cause-group rates, and has a magnitude 100 times that of the crude death rate shown in Tables 14 and 16. The populations used in the computation of rates in this table may be found in Table 4.

Rates are computed only for those distributions in which the total number of deaths from all causes numbered 1,000 or more and those classified as due to senility and ill-defined or unknown causes (*B45*) did not exceed 25% of the total. The limitation of rates to distributions totalling 1,000 or more is based on the lack of reliability of rates based on very small frequencies. The second criterion is based on the premise that if 25% of the deaths have been coded as due to senility, undefined or unknown causes, the other 49 causes in the List must be understated to a marked degree. The limit has been placed deliberately high; it might better be at 10% to exclude all poor data. Moreover, it must be admitted that this criterion fails to consider the equally indicative percentages in *B46*—a residual category which often accounts for an inordinately large proportion of the whole.

In one or two instances it may be noted that the rate for all causes does not agree exactly with the corresponding total death rate shown in Tables 14 or 16. This lack of agreement is due primarily to differences in the total of deaths tabulated by cause. Such differences might be the result of the omission from the tabulation by cause, of reports which were delayed unduly, or the exclusion from the cause distribution of those infants born alive who died within 24 hours of birth or before registration, and who, therefore, were registered as stillbirths. In several countries, tabulation procedures have been devised to separate these pseudo-stillbirths from true stillbirths and to incorporate them into the total deaths, but even in these cases there is no way of knowing the cause of the death, since it is not registered.

Per cent medically certified is the number of medically certified deaths in each cause group, per 100 total deaths in the same group. The complement of the percentage may be interpreted as the proportion of lay certified deaths, although it includes also type of certification unknown.

Limitations: Cause-of-death statistics, which are of the greatest importance from both the public health and demographic point of view, are unfortunately subject to many defects in addition to those already described as limiting the international comparability of vital statistics in general and death statistics in particular. These additional limitations arise mainly from differences among countries

[46] For comparability of statistics of cause of death according to the fifth and sixth revisions of the International List, see Comparability of Statistics of Causes of Death According to the Fifth and Sixth Revisions of the International List (World Health Organization, *Bulletin,* Supplement 4), Geneva, 1952.

[47] *Principles for a Vital Statistics System, op. cit., Principle* 309 (4).

[48] *Ibid.*

[49] Manual of the International Statistical Classification of Diseases, Injuries, and Causes of Death; Sixth Revision of the International Lists of Diseases and Causes of Death adopted 1948, Vol. 1 (World Health Organization, *Bulletin,* Supplement 1), Geneva, 1948.

in the quality, availability, and efficiency of medical services, certification procedures, and coding practices.

When a death is registered and reported for statistical purposes the cause of death is required to be stated in most countries. This statement of cause may have several sources: (1) If the death has been followed by an autopsy, presumably the "true" cause will have been discovered. (2) If an autopsy is not performed but the decedent was treated prior to his death by a medical attendant, the reported cause of death will reflect the opinion of that physician based on observation of the patient while he was alive. (3) If on the other hand, the decedent has died without medical attendance, his body may be examined (not autopsied) by a physician who, aided by the questioning of persons who saw the patient before death, may come to a decision as to the probable cause of death. (4) Still another possibility is that a physician or other medically trained person may question witnesses without seeing the decedent and arrive at a diagnosis. (5) Finally, there is the case where witnesses give the cause of death without benefit of medical advice or questioning.

These 5 possible sources of information on cause of death constitute in general 5 degrees of accuracy in these data. However, data in Table 17 reflect none of these precisely. In some countries[50] "medically certified" means "certificate signed by a doctor", which can represent any or all of the first four possibilities listed above. In other countries, the same category may mean "attended by a doctor before death". It will be evident that care must be taken in comparing the percentages from country to country. Despite their limitations, they do afford an index to the quality of cause-of-death statistics. They also provide insight into the causes which are receiving the attention of medical personnel.

Serious difficulties of comparability may stem also from differences in the form of death certificate being used, an increasing tendency to enter more than one cause of death on the certificate, and diversity in the principles by which the primary or underlying cause is selected for statistical use when more than one is entered.[51]

Differences in terminology used to identify the same disease also result in lack of comparability in statistics. These differences may arise in the same language in various parts of one country, but they are particularly troublesome between different languages. They arise even in connexion with the medically certified deaths, but they are infinitely more varied and obscure in cause of death reported by lay persons. This problem of terminology and its solution are receiving attention by the World Health Organization in the Centres for Classification of Diseases—in particular in the Latin American Centre in Caracas, Venezuela.

Coding problems, and problems in interpretation of rules, arise constantly during the interval between revisions of the International Statistical Classification of Diseases, Injuries and Causes of Death. Lack of uniformity between countries in these interpretations and in adapting rules to national needs result in lack of comparability, which can be observed in the statistics. They are particularly evident in causes which are coded differently according to the age of the decedent, such as pneumonia, diarrhoeal diseases, and others. Changing interpretations and new rules can also introduce disparities into the time series for one country. Hence, large increases or decreases in deaths reported from specified diseases should be examined carefully for possible explanations in terms of coding practice, before they are accepted as changes in mortality.

Except for the hidden differences produced by the factors described above, the various categories of the Abbreviated Classification should be nominally comparable. However, attention must be called to an anomaly which exists in some distributions—particularly in countries of Asia and the Caribbean—in connexion with deaths due to accidents and violence. In these distributions, some deaths normally classifiable according to the External Cause (E) classification as *BE47-BE50* have been so distributed, but a second group of deaths has been classified *only* according to the Nature of Injury (N) classification. This makes it impossible to show the 4-category *"BE"* detail for these deaths and they are, therefore, shown as a group.

Whenever known, other aberrations are noted in the tables. However, particular care must be taken in using distributions with relatively large numbers of deaths attributed to senility, unknown, and ill-defined cause (*B45*). The all-other-causes group (*B46*) must also be scrutinized. Large frequencies in the two categories, *B45* and *B46*, may indicate that causes of death among whole segments of the population have been undiagnosed, and the distribution of known causes in such cases is likely to be quite unrepresentative of the situation as a whole. An examination of the distributions from this point of view, together with the general quality code found in Table 14 and the information on medical certification should provide a basis for a rough evaluation of the quality of cause-of-death statistics. For a more detailed discussion of the development of statistics of causes of death and the problems involved, see Chapter II of the 1951 *Demographic Yearbook*.

Table 18

Table 18 presents, for the first time since 1957, deaths by cause and age for each sex. Data for only one year (the latest available) are included because of space limitations, and that year is most often 1959 or 1960. These, together with the pre-1950 years' experience shown in the 1951 *Demographic Yearbook* and the data for 1955 or 1956 shown in the 1957 *Demographic Yearbook*, provide some information on which comparisons may be made over time, keeping in mind the possible lack of continuity between the 1938 and 1948 Revisions of the List (see p. 35).

Cause of death is defined as *the morbid condition or disease process, abnormality, injury or poisoning leading directly, or indirectly, to death.*[52] Both the immediate and the underlying causes are reported on the medical certificate of death, but the *underlying cause* is the one to be adopted for tabulation of mortality statistics. It is defined as (a) *the disease or injury which initiated the train of morbid events leading directly to death, or* (b)

[50] El Salvador, Mexico, Uruguay.

[51] Comparability of Statistics of Causes of Death . . . , *op. cit.*

[52] *Principles for a Vital Statistics System, op cit., Principle* 309 (4).

the circumstances of the accident or violence which produced the fatal injury.[53]

Age is age at last birthday, or completed years, as defined for other tables showing this characteristic.

The classification of cause of death is the same as that used in Table 17, namely, the Abbreviated List of 50 Causes for Tabulation of Mortality from the International Statistical Classification of Diseases, Injuries, and Causes of Death—the 1948 (sixth) revision of the international lists.[54] However, in this table, the stub consists of the *Abbreviated List Numbers B1* to *BE50;* for the full titles and the detailed list numbers included, reference must be made to Table 17, p. 398 for the English and p. 471 for the French.

Age is classified into 8 categories, including under 1 year, 1-4 years, 5-14, 15-24, 25-44, 45-64, 65 and over, and unknown. This scheme represents a consolidation of internationally recommended age classifications,[55] but the groups selected correspond to the major stages of life from infancy to old age and reflect the characteristic age distribution of particular diseases.

Coverage: Table 18 contains one cause-age-sex distribution for 55 geographic areas. This is somewhat fewer than the potential capacity of the table. The first criterion employed for inclusion was that total deaths for both sexes combined totalled at least 1,000. The second criterion was that deaths be coded by cause according to the 1948 or 1955 Revision of the International List and tabulated by the Abbreviated List of 50 Causes for Tabulation of Mortality or by a tabulation list directly convertible to it, e.g., the Intermediate List. A third criterion was that the frequency in category *B45 (Senility, without mention of psychosis, ill-defined and unknown causes)* accounted for less than 25% of the total deaths for at least one of the sexes.

Limitations: These data are subject to all the qualifications of death statistics in general and, in addition, those produced by errors in age reporting and in certifying and classifying cause of death. Since these have all been set forth in connexion with other tables, they will not be repeated here. Reference should be made to the text of Table 15 for age-reporting problems and to that of Table 17 for difficulties of cause-of-death reporting and classifying. The general accuracy of these cause-of-death statistics may be judged from the proportions of deaths from each cause reported to have been medically certified set forth in Table 17.

Every effort has been made to query doubtful cause/age frequencies, as for example, deaths from suicide (*BE49*) or homicide (*BE50*) at infant and childhood ages; where these cases remain in the statistics they are noted as probably due to imperfect coding. On the other hand, deaths reported as due to complications of pregnancy (*B40*) which would normally be expected only among females in the reproductive ages, appear unnoted at older ages because coding practices in some countries allow this cause to be acceptable beyond the childbearing period.

[53] *Ibid.*

[54] Manual . . . , *op. cit.,* p. 361.

Table 19

Death rates by cause of death, specific for age and sex, for the latest available year are set forth in Table 19. The year to which rates refer is dictated by the availability of a distribution of population by age and sex corresponding to the absolute numbers of deaths classified by these characteristics. Since the necessary base population is often available only from a census of population, the years shown in Table 19 are not as recent as those for which absolute numbers are available in Table 18.

This is the second time that age-sex specific rates by cause have been included in the *Demographic Yearbook,* the first time being the compilation published in the 1957 *Demographic Yearbook.* That previous compilation included rates primarily for 1955 or 1956. The present table contains rates for 1959 or 1960 for the same countries as appeared in the earlier *Yearbook,* thus providing some basis for comparison over time.

The definition and classification of cause is the same as that in Table 18. The definition and classification of age is the same as in Table 18, except that there is no unknown-age category for rates.

Data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than in roman type. A description of the basis for this quality specification may be found on p. 16.

Coverage: Rates for 39 countries and territories are shown in Table 19 by cause, age and sex. The number of areas able to be included is sharply limited by lack of an appropriate population base for computation of rates specific for the characteristics involved.

Rate computation: Rates for ages 1 and over are the number of deaths in each cause-age-sex group per 100,000 population of the same age and sex; mortality rates for infants under 1 year of age are computed per 100,000 live births of the same sex in the same year. Deaths for which age was unknown have not been distributed; they are included only in the rates for all ages combined.

Limitations: The rates in Table 19 are subject to the limitations of death statistics and indirectly to those of population statistics. Errors in age reporting also constitute a factor in assessing comparability.

International comparisons of cause-of-death rates are fraught with very real dangers of misinterpretation, not only because of the variation between countries in the proportion of deaths medically certified for cause (see Table 17), but also because of the lack of uniformity in the method of selecting the principal cause when more than one is given on the certificate. Final statistical classification of the reported cause poses another potential source of variation. These, together with more general factors, have been discussed in connexion with Tables 17 and 18; they were discussed in more detail in Chapter II of the 1951 *Demographic Yearbook* and in the *Handbook of Vital Statistics Methods,* to which reference may be made.

Table 20

Deaths by marital status, age and sex of the decedent are shown in Table 20 for the latest year available.

Deaths by marital status and sex are included when the cross-classification by age was not available.

This is the second time these statistics have been included in the *Demographic Yearbook.* They were first shown in the 1958 *Demographic Yearbook* as elements for the study of dissolution of marriage; they are included in this issue as statistics useful for the analysis of mortality patterns.

In this table, marital status is classified into a maximum of seven and a minimum of four categories, depending on availability of data. The minimum, which is standard for the table, comprises single, married, widowed and divorced; these are augmented—if the data permit—by two sub-classes of married, namely, consensually married and separated, and by unknown if required. When the four standard categories appear unqualified, they are assumed to be constituted as follows: (1) single, i.e., never married (including annulled); (2) married, including persons in stable *de facto* (customary or consensual) unions and persons legally or *de facto* estranged, i.e., separated, from their spouses; (3) widowed, not re-married; (4) divorced, not re-married. Changes in the stub, footnotes or brackets have been used to explain deviations from the above.

Age, defined here as elsewhere in the *Demographic Yearbook* as completed years, is classified into 11 categories, beginning with under 15, 15-19, 20-24 and thence proceeding in 10-year age groups to 75-84, 85 and over, and unknown. When statistics did not conform exactly to these classes, bars or footnotes are used to indicate the new limits.

It will be noted that data for the under-15 category are sometimes shown as not available (...). This indicates that the tabulation of deaths by marital status is not made for persons under 15 years of age on the assumption that all are single. The absurdity of this assumption for some countries may be seen by reference to the minimum marriageable age given in Table 28 and also to the distribution of population by marital status, last shown in the 1958 *Demographic Yearbook.*

Data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than in roman type. A description of the basis for this quality specification may be found on p. 16.

Coverage: Data for 37 areas are shown in Table 20 by marital status, age and sex and an additional 16 distributions by marital status and sex alone are shown at the end of the table.

Limitations: These death statistics are subject to all the limitations described on p. 33, including unreliability, variation in coverage and so forth. Only the total deaths and those under 15 years are affected by the definitions which result in the exclusion of infants born alive who die before registration of birth, but frequencies at all ages are subject to the age-reporting errors described on p. 14 and mentioned in connexion with Table 15.

Comparability is affected by the accuracy of the response to the question on marital status of the decedent. In connexion with population enumeration, it is believed that many divorced persons report themselves as single, married or widowed, while married males separated from their spouse, may report themselves as single. There are no data which would allow an evaluation of this factor in respect of death reporting, but it seems reasonable to assume that incorrect response would be less likely to occur on death reports. This is so because information on death is usually supplied by a relative of the decedent who would presumably have the correct information and, moreover, the factors inducing an incorrect report are not so operative after the death of the person concerned. However, this factor would need to be kept in mind when rates are computed.

Variation in the composition of the marital status categories may also be a factor in comparability. The disposition of decedents whose marital union was a consensual one, is a case in point. Because it is believed that the marital status of most of these would be reported as "married", the United Nations has recommended that when deaths in this class are not tabulated separately, they be included with married. The degree to which this recommendation is followed is not known. Similarly with the category separated: decedents who were separated from their spouse at the time of death are to be considered as "married" for purposes of this table, but the category is known to be included with divorced in some cases. Unknown marital status poses problems also. In some countries, no deaths are recorded as being of unknown marital status—because a status has been assigned to the decedent before tabulation. In other countries, this category shows considerable frequencies. These possible differences in the composition of marital status categories should be borne in mind in comparing frequencies.

One further limitation must not be overlooked in using the data from this table. It concerns the homogeneity, in so far as marital history is concerned, of the persons represented by the frequencies in the various marital status categories. In this respect, only the single may be said to represent a homogeneous group. Decedents reported as married may have been previously divorced or widowed; those classified as divorced were previously married and some may also have been previously widowed; widowed persons were previously married, widowed or divorced. Because of this overlapping of categories, none, with the exception of single, is actually complete as regards marital history. All exclude persons who have changed status. This factor must be taken into consideration in evaluating mortality differentials.

Table 21

For the first time in the *Demographic Yearbook,* death rates specific for marital status, age, and sex for the latest available year are set forth in Table 21. The year to which the rates refer is dictated by availability of a distribution of population by marital status, age and sex, and the absolute numbers of deaths classified by these characteristics. Since the necessary base population is generally available only from a census of population, the years shown in Table 21 are not as recent as those for which frequencies are available in Table 20.

Marital status and age are defined and classified as they are in Table 20 except that categories for unknown age and unknown marital status are omitted in the rate table (see Rate Computation below). As in Table 20, data for the under-15-years category are sometimes shown as not available because the tabulation of deaths by marital

status is limited to decedents of 15 or more years of age.

Data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than in roman type. A description of the basis for this quality specification may be found on p. 16.

Coverage: Rates for 20 countries and territories are shown in Table 21 by marital status, age and sex, and an additional 19 are available by marital status and sex alone. The number of areas able to be included is sharply limited by lack of an appropriate population base for computation of rates specific for the characteristics involved.

Rate computation: Rates are the number of deaths in each age/sex/marital status group per 1,000 population in the same group. Deaths at unknown age or of unknown marital status are not distributed nor are rates computed for them.

Limitations: Because these rates specific for marital status, age and sex are based on frequencies similar to those set forth in Table 20 and computed on corresponding populations, they are subject to the same limitations of comparability as are described in connexion with Table 20. These include problems of definition, response and classification of age and marital status of decedents, as described on p. 38, and also the analogous problems of the reporting and classification of these topics encountered in connexion with census taking. For deficiencies in the census data, reference may be made to the 1958 *Demographic Yearbook,* pages 24-25.

There is evidence that the errors in these two different methods of data collection (i.e., civil registration and enumeration) may not be exactly the same and that errors of response may be more numerous in connexion with the census. This may be due, in part, to the fact that the respondent in a census enumeration is not necessarily the person who is cognizant of the true facts concerning the age or marital status of another member of the household on whom he is supplying information to the enumerator. Age, for example, may more often be reported at the census in digits ending in zero or five. Divorced and separated persons may erroneously be reported as single at the census, while those in consensual unions, if not reported separately, will more likely be enumerated as married than in the true marital status which would likely be reported at death registration. For the same reason, marital status is more likely to be recorded as unknown at the census, than it is at death registration.

However, the actual extent of these theoretical inconsistencies may be judged from an investigation of the comparability of reports on marital status between the census of population and the civil register of death recently completed *inter alia* by authorities in the United States.[56] According to this retrospective study, the married group has the highest level of correspondence, 97 per cent; and the single, widowed, and divorced groups ranged downward at 88, 82 and 69 per cent, respectively. A British study,[57] very similar in approach to the United States investigation, showed that 97 per cent of the male decedents 35 to 64 years old were reported in the same marital status category in the two sources; for the married group, the figure is 98 per cent; for the single, 88 per cent; and for the widowed and divorced together, 94 per cent.

In addition to differences in response which are due primarily to differences in the identity of the informant, census statistics may be classified by age and especially marital status in a different way. It is obvious, for example, that independent categories for consensual unions and separated appear much more often in population census data than they do in distributions of deaths by marital status.

Finally, in using rates specific for marital status and age for analysis of mortality, cognizance must be taken of the fact that with the exception of the group reported as "single", the various categories cannot be viewed as comprising a homogenous group of people in so far as marital history is concerned. Decedents reported as married at the time of death may have been previously widowed or divorced; widowed persons may have previously been divorced and *vice versa.* Differentials observed in the rates must be studied with this factor in mind.

Table 22

Table 22 presents for the second time in the *Demographic Yearbook* available distributions of deaths of males according to age and occupation of the decedent. Data are brought together here not as comparable statistics but to give some indication of how many countries have made this tabulation in recent years and to stimulate the development of comparable statistics for this mortality characteristic. A table showing data for 14 countries was first shown in the 1957 *Demographic Yearbook* with data relating primarily to a year within the period 1952-56.

Table 22 is limited to male deaths because corresponding data for females are relatively useless for analytical purposes. This is so because a much smaller proportion of women than of men are engaged in occupations and a large proportion of those employed leave their occupation on marriage; thus, a distribution of female deaths by occupation reveals a great majority of the deaths in the not-classifiable category. One solution (adopted in the United Kingdom) is to classify deaths of married women according to occupation of their husbands. Such statistics then provide a means of evaluating the forces of socio-economic levels isolated from occupation.

In Table 22, data are presented in the form in which they were received from official sources. No attempt has been made to standardize the occupation classification, although there is no way of knowing whether or not the national tabulation was made originally in the standard form of Table 22.

It is assumed that occupation is defined as *the trade, profession, or type of work performed by the individual.*[58]

The classification of occupation requested was the 10 classes which are consistent with the major groups of the International Standard Classification of Occupations

[56] *The Comparability of Reports on Occupation from Vital Records and the 1950 Census.* U.S. Department of Health, Education, and Welfare, Public Health Service, National Office of Vital Statistics; *Vital Statistics—Special Reports,* Vol. 53, No. 1. June 1961. p. 24.

[57] General Register Office, *1951 Census of England and Wales, General Report,* H.M. Stationery Office, London, 1958.

[58] *Principles for a Vital Statistics System, op. cit., Principle* 309 (22).

(ISCO).[59] Twelve countries have supplied data in this form, while 3 have used a classification which varies from this standard. In El Salvador, the closely related COTA Classification[60] has been used while Italy and Yugoslavia utilize a national classification. None of these is directly comparable with all others, and caution must be used in attempting comparisons.

Age is defined as "completed years", i.e., the difference between the day, month and year of birth and day, month and year of death. Age has been classified in 9 categories, namely under 15, 15-19, 20-24, 25-34, 35-44, 45-54, 55-64, 65 and over, and unknown. Except for the terminal group, this is the same scheme used for the economically active population by occupation and age at the census in accordance with international recommendations.[61]

Data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than roman type. A description of the basis for this quality specification may be found on p. 16.

Coverage: A total of 15 countries and territories are able to produce mortality statistics for males classified by occupation.

Limitations: In addition to all the limitations of death statistics in general, deaths by occupation are subject to other qualifications—primarily of a reporting and coding nature. Since these have been admirably set forth in a study made by the International Labour Office in 1930,[62] only the most obvious problems will be mentioned below; the first concerns the collection of the data.

The question on occupation in the death statistical report is formulated in a variety of ways, all of which boil down to two general types. In some cases, the question refers to the actual occupation of the decedent at the time of his death; in others, the *usual* occupation may be required. These two types of questions raise problems of comparability, especially in respect of older persons who were retired at the time of death. In one country, their former occupation may have been reported, while in another, the current occupation (retired) would have been given. For information on country practice in this respect, see *Handbook of Vital Statistics Methods, op. cit.*, p. 133 and Table 14.

A second important error derives from the fact that the death reporting is done by a person who may not be familiar with the occupation of the decedent and who may, therefore, give an incorrect reply to the question. This source or error, however, cannot be very much greater than the errors in age reporting. Moreover, it is anticipated that the errors may well be absorbed in the broad-category classification employed in Table 22.

Another source of non-comparability arises in the coding and classifying of the occupation as reported. An acceptable international standard classification has only recently been developed, and many countries have in the interim utilized their own classification. In such cases, convertibility of the detailed categories to the international standard might be feasible, but achievement of comparability at the abbreviated ten-category-classification level is not possible. Even data which appear to be classified by the same scheme should be viewed with skepticism until more is known of the basic coding.

Finally, it should be noted that some of the distributions have been made for the economically active population only. Others are for persons who have *ever* been economically active, i.e., the economically active plus those retired. In such cases, an eleventh category of no occupation has been added, in which the residual is given. It should be noted that where "none" is not a category and the frequencies not classifiable elsewhere are large, the suspicion is probably justified that decedents without an occupation have been placed in the not-classifiable category. In any case, a high proportion of deaths not classified by occupation impairs the distribution, and care should be used in interpreting these statistics for analytical purposes.

Table 23

For the second time in the *Demographic Yearbook,* mortality rates specific for occupation, age, and sex are presented. These are the latest available rates computed by the countries where the data originated. They are shown in this issue of the *Yearbook* as they were in the 1957 volume as a stimulant to further work in the field.

Age and occupation are assumed to be defined in the same way as they were for the absolute numbers shown in Table 22, even though those numbers may not be the basis of these particular rates.

To eliminate some of the problems of achieving correspondence between the occupation reported on the census schedule and that on the death report, the classification has been made broad in each case. This lack of detail also helps to eliminate the problem of establishing duration of occupation, i.e., how long the decedent actually worked in the occupation category where he is classified. Mobility between broad groups shown is probably not significant.

The age classification is that shown in Table 22 and that for which population by occupation, age, and sex is usually available.

Coverage: Rates for only four countries are available, namely, Japan, France, England and Wales and Scotland.

Rate computation: Rates are the number of deaths in each age-sex-occupation group per 100,000 population of the same group. No attempt was made to compute rates in the Statistical Office because of the myriad problems of correspondence not able to be solved without detailed knowledge of the basic data and their definitions and the methodology involved. For details of the method used and the adjustments made to achieve correspondence between the deaths and the population at risk in the series shown, see the national publications dealing with this subject.[63]

United Kingdom, General Register Office, *The Registrar General's Decennial Supplement, England and Wales, 1951* (Occupational Mortality, Part I), London, 1954, 75 pp.

Limitations: All of the limitations set forth in connexion with Table 22 are operative here. In addition, there is the major problem of achieving correspondence between the population at risk and the deaths which occurred.

As noted above, broadening the occupation categories helps to adjust for some of the possible discrepancies. Also, limiting the distribution to males of selected ages helps to eliminate some areas of special difficulties. However, the basic problem remains of evaluating the adequacy of the rates by measuring differences in the reporting of occupation on the schedules of the population census and on the death certificates originating in the civil registration system. To obtain some idea of the magnitude of differences, a United States and British study may be of interest.

In the USA, a survey was undertaken to find out how well the occupation reported on the death certificates of white males, aged 45-64, who died during the period May-August 1950 agreed with that recorded on the corresponding 1950 census schedules, completed 1 April 1950. Details of the methodology adopted may be found in the source document.[64]

It may be noted that the death record called for "usual occupation" and the industry in which the occupation was followed, irrespective of whether the person was working or not at the time of death. The 1950 census schedules called for, first, an indication of the person being a member of the labour force, i.e., employed or seeking work at the time of the census, and, for each person in the labour force, the occupation of his present job, if then employed, or of the last job for those seeking work. Thus, according to the census definition, job information was not obtained for persons outside the labour force at the time of the census because they were retired, unable to work, attending school, etc. This alone would account for some of the differences turned up by the study, and it must be kept in mind as perhaps the most important limiting factor in obtaining correspondence between the numerator and the denominator in computing occupational mortality rates.

Comparability of occupational reporting was also studied in an investigation conducted by the General Register Office of the United Kingdom as part of its critical evaluation of the results of the 1951 Census of England and Wales.[65] The British study consisted of matching death certificates filed during the week of 1-7 May 1951 against the census schedules completed 8 April 1951. Both the census schedule and the death report in England and Wales call for "present" occupation (or last occupation if the person is retired at the time of the census or at date of death) unlike the current/usual occupation required in United States records. The conclusion of the British study is as follows:[66]

> *"In summary it may be said that, while the occupation classification sometimes falls victim to the combined forces of its own specificity and the human capacity for variation in description, the general impression emerges that the level of reliability of occupational assignment at the census justifies the statistical analyses which are based thereon. While discrepancies between census and death records are sometimes favorable and sometimes unfavorable to the status of the deceased, there is on balance a tendency for the social standing of a group to be slightly raised on the basis of death registration as compared with the census. It seems likely that, though both the deceased, at the census, and their widows (or other informants), at death registration, tend to use flattering descriptions of recent employment or to select an earlier occupation if this appears to them of greater weight, there is rather less inaccuracy of this kind at the census, surrounded as it is with an atmosphere of fact-finding and of legal persuasion, and conducted with more publicity and instructional assistance than is death registration. The shift in socioeconomic distribution is not sufficient seriously to threaten the validity of the occupational mortality analyses."*

A non-occupational factor, the influence of which on comparability of mortality by occupation must be kept in mind, is marital status. Mortality varies with marital status, and these variations may obscure occupational differentials.[67]

Table 24

Table 24 gives the "expectation of life" ($\mathring{e}_x$) or the average number of years of life which would remain for males and females reaching the ages specified if they continued to be subjected to the same mortality conditions as obtained in the period mentioned. These data come from the official life tables of the countries concerned; none of the functions has been derived in the Statistical Office of the United Nations.

Values from each life table available—complete or abridged—for the period 1940-1960 are included. Values from tables relating to the period 1900-1940 may be found in the 1957 *Demographic Yearbook* for ages 0, 1, 2, 5, 10, 15, 20, 30, 40, 50, 60, 65 and 70, and in the 1953 *Demographic Yearbook* for the same ages as are included in Table 24.

In Table 24, male and female expectations are shown separately for selected ages beginning at birth (age 0) and proceeding with ages 1, 2, 3, 4, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80 and 85 years.

Data are shown to the number of digits provided in the official computation, thus producing a mixture of one and two decimal values.

Since this function comes from an official life table and since it is assumed that, if necessary, the basic data (population and deaths classified by age and sex) have been adjusted for deficiencies before their use in constructing the life table, no attempt has been made in the Statistical Office to evaluate the quality of the values, and hence none are set in italics.

Coverage: Values are available in Table 24 for 83 countries and territories. Lack of reliable base data restricts the number of areas for which life tables can be con-

[64] *The Comparability of Reports on Occupation from Vital Records and the 1950 Census, op. cit.*

[65] *1951 Census of England and Wales, General Report, op. cit.*

[66] *Ibid.*, pp. 55-56.

[67] For a more detailed discussion of these factors and others, see *Statistical Methods for Measuring Occupational Morbidity and Mortality, op. cit.*

structed but, even so, the coverage has increased notably in the last few years.

Limitations: Expectation-of-life values are subject to all the limitations set forth on page 20 in the discussion of the life tables and also to the limitations of population and mortality statistics in general.

Perhaps the most important specific qualification which can be set forth in connexion with expectation of life values is that they must be interpreted strictly in terms of the underlying assumption that surviving cohorts are subjected to the age-specific mortality rates of the period to which the life table refers. Thus, in interpreting $\mathring{e}_{50}$ in the 1945-1950 life table for Norway it may be said that, if males reaching age 50 were to experience for the rest of their lives the same age-specific mortality rates that obtained during the period 1945-1950, they would, on the average, live 26.4 years past the age of 50 or to 76.4 years of age. Experience during the past decades has indicated, however, that an assumption of unchanging mortality in fact understates the expectation of life, since mortality rates are decreasing almost universally.

Table 25

Life-table mortality rates for 1940-1960 by sex, that is, the probability of dying within one year (or within a specified age interval) for men and women who have reached the exact age specified in the box-head, are shown in Table 25. The age-specific mortality rate is the basic function of the life table; it is commonly described by the symbol q_x, in which the subscript "x" refers to the age. The values shown in Table 25 are expressed as 1 000 q_x and represent the number dying at age x per 1 000 persons reaching age x, or the probability per 1 000 of dying within one year (or within the specified age interval) after reaching age x. The ages for which rates are presented in Table 25 are 22 in number, i.e., 0, 1, 2, 3, 4, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80 and 85 years.

The life-table mortality rate differs from the central death rate in that it refers to persons reaching the given age during the course of a year, rather than to persons of that age in the middle of the year. Thus, the rates are similar in concept to the infant-mortality rates shown in Table 14. But the life-table mortality rate for infants under 1 year of age usually differs from the infant-mortality rate shown in Table 14 because it reflects an adjustment made to ensure that infant deaths are related to the cohort of births among which they occurred.

The complete life table gives rates for each single year of age; an abridged life table gives rates for collective ages, usually 5-year age groups. Some of the data in Table 25 are of the latter type and are so indicated by run-in box-heads. In these cases, the mortality rate is the probability of dying, not within one year after reaching the age indicated, but within the number of years specified by the age group.

Since this function comes from an official life table and since it is assumed that, if necessary, the basic data (population and deaths classified by age and sex) have been adjusted for deficiencies before their use in constructing the life table, no attempt has been made in the Statistical Office to evaluate the quality of the values, and hence none are set in italics.

Coverage: Rates are shown in Table 25 for 69 geographic areas. Lack of reliable base data restricts the number of areas for which life tables can be constructed but, even so, the coverage has increased notably in the last few years.

Limitations: Life-table mortality rates are subject to all the limitations of population and vital statistics in general. The method of computing the rates has been described in general terms on p. 20. Special problems arise in deriving q_x values for the very young ages and for the end of life. For the young ages, q_x values are frequently obtained by using the statistics of births occurring in the proximate years and estimating from them the number of persons at risk of dying in the period to which the life table relates. At the older ages, data are frequently so scanty or unreliable that they have to be subjected to considerable manipulation if a reasonable series of q_x values is to be derived from them. In many cases, the life-table q_x values at the older ages do not depend in any way on the registered deaths at those ages, but have been estimated on the basis of q_x figures for younger ages.

Although the aberrations due to age reporting are usually "smoothed out" to obtain a succession of reasonable values from age to age, comparability may be impaired by differences in methods of adjustment.

Table 26

Life-table survival values for males and females separately from each official life table available for the period between 1940 and 1960 are presented in Table 26.

These, commonly known as l_x values, are derived from the q_x of the life table; they represent the number of males or females surviving to each successive age or central age out of a cohort born alive and subjected thereafter to the mortality rates of the given life table. In other words, these values are the proportion of persons born alive who are expected to survive to any given age x.

The radix of the life tables (the initial cohort) is usually 100 000, although in some cases shown in Table 26, it is 10 000 or 1 000. The ages shown are 0, 1, 2, 3, 4, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80 and 85 years.

Since this function comes from an official life table and since it is assumed that, if necessary, the basic data (population and deaths classified by age and sex) have been adjusted for deficiencies before their use in constructing the life table, no attempt has been made to evaluate the quality of the values, and hence none are set in italics.

Coverage: Table 26 includes survival values for 69 geographic areas. As noted in connexion with Tables 24 and 25, the number of areas for which values are available has increased despite the lack of reliable base data.

Limitations: Like other values from the life table, the number of survivors are subject to the general limitations of the basic population and death statistics and, in addition, to variations in the methods used to construct the life table. These have been described on p. 20.

The uncertainty of mortality rates at the very young and older ages introduces a special problem, as noted in

connexion with Table 25. Because of this, values for older ages especially are little more than estimates.

Table 27

Table 27 is the regular trend table of marriages and marriage rates, which in this issue shows data for each year 1952-1961.

Unless otherwise specified, the statistics refer to formal marriages performed, that is, to the legal union of persons of opposite sex, the legality of which may be established by civil, religious or other means recognized by the law of each country. They are statistics of marriages, not of persons marrying.

In accordance with the usual practice, the quality code (C, U and . . .) is presented in the first column of the table and, in addition, data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than roman type. A description of the basis for this quality specification may be found on p. 16.

Coverage: Marriages and crude rates are shown for 153 geographic units. Major areas, though lacking recent data, are included and data for sub-national segments of population are presented when statistics are not available for the country as a whole. Such data are of minor significance, but they do serve to designate the areas for which marriage statistics are obtainable on a national basis. Since rates based on very small numbers are subject to large errors, a few areas showing frequencies consistently less than 15 are excluded.

Rate computation: The rates in Table 27 are the number of marriages reported per 1,000 persons present in the same area at the mid-point of the year in question. The populations are official figures and usually those presented in Table 4. Every effort was made to achieve strict correspondence between the numerator of the rate (marriages) and the denominator (population), and notes are used to describe instances where correspondence could not be obtained.

Limitations: Data in this trend table are subject to almost all the limitations of vital statistics set forth on p. 16, as well as those pointed out in connexion with marriage statistics specifically. They suffer from national variations in statistical definitions; they are deficient as indicators of *de facto* family formation to the extent that consensual unions exist; even as measures of formal marriage incidence, they are unreliable to the extent that they are incomplete. However, it must be emphasized that since marriage is a legal rather than a biological event, the problem of comparability in the sense of complete and incomplete data takes on a somewhat different aspect. This should be borne in mind in using the quality-of-data code C and U, which appears in the first column of the table.

High incidence of consensual unions will be especially noticeable in the rates, because the range of formal marriage rates is relatively narrow and marked divergence is almost always due to a preponderance of *de facto* rather than *de jure* unions. Lack of comparability from this factor is especially evident in abnormally low marriage rates for parts of Latin America and Africa.

As will be seen from the footnotes, strict correspondence between the numerator of the rate and the denominator is not always obtained; for example, marriages among civilian and military segments of the population may be related to civilian population. The effect of this may be to increase the rates or, if the population is larger than that from which the marriages are drawn, to decrease them but, in most cases, it is probably negligible. The potential size of the effect may be judged from the rate series for Gibraltar.

The symbol (†) is used here, as elsewhere in the *Demographic Yearbook,* to indicate that data have been tabulated by date of registration, rather than by date of occurrence or performance, in this case. As was pointed out on p. 18, this qualification is not particularly important in connexion with marriages because, in most cases, registration is a prerequisite for, or equivalent to, performance. However, since there are some countries in which a potential time interval may exist between performance of a marriage and its registration,[68] the implications of the symbol should be considered in relation to the data it qualifies.

Finally, it should be emphasized that crude marriage rates—like crude birth and death rates—are not probability indices, because they take no cognizance of the age-sex-marital-status structure of the populations to which they relate. Nevertheless, they do measure levels and changes in marriage frequency. For more details on the uses of crude marriage rates, see Chapter I of the 1958 *Demographic Yearbook.*

Table 28

Marriages classified by age of bride and, separately, by age of groom are set forth in Table 28 for the latest year available. This table, which shows the age characteristics of persons marrying, has been one of the 16 annually recurring tables since 1957.

Age is defined as completed years at last birthday, in accordance with the United Nations' recommendations,[69] that is, it is computed by subtracting day, month and year of birth from day, month and year of marriage. The age classification is that recommended by the United Nations,[70] modified to conform to limitations of space; categories included are 12 in number, namely, Under 15 years, 5-year age groups to 59, 60 and over, and unknown, and the same classification is used for both brides and grooms.

A new feature in this table, introduced for the first time this year, is the inclusion of two columns showing minimum age for marriage of brides and corresponding ages of grooms. "Marriageable age" is that which must be attained before persons are allowed to contract a marriage which is valid before the law. After this age, in most countries, the interested parties are required to obtain the consent of their guardians until they have reached a more advanced age, usually 21 years. In some countries, provision is made under certain circumstances for the minimum age requirement to be waived by a competent authority; in other countries (United King-

[69] *Principles for a Vital Statistics System, op. cit., Principle* 309 (c) (1).

[70] *Ibid., Principle* 410 (e) (23).

dom, New Zealand, etc.) there is no provision for dispensation or waiver. The age data are included in this table in order that the reader may evaluate the meaning of the frequencies shown at ages up to 24 years.

Data believed to be unreliable (incomplete) as determined by the quality code (see p. 16) are set in italics rather than in roman type. If incompleteness is assumed to be evenly distributed throughout the age span, then such data may still be of value as indicators of the age pattern of marriages, even though the absolute levels may be deficient.

Coverage: Table 28 includes marriages by age of bride and groom for 114 geographic areas. Data for sovereign and non-self-governing territories are included so long as the distribution totalled at least 50 marriages. Major countries are shown even though figures for recent years are lacking, and data for ethnic segments of the population are presented when statistics are not available for the whole population.

Limitations: All the limitations of vital statistics and of marriage statistics in particular influence comparability of data in Table 28. As in Table 27, the definition of marriage is assumed to be formal, recognized unions, entered into according to the law of each country. Deviations from standard are footnoted; they include marriage licences issued, marriages recorded in church registers only, inclusion of marriages resumed after a separation and so forth.

Limitations are also imposed by the factor of age. Age-reporting errors in censuses of population have been described on p. 14. It is probable that biases are less pronounced in marriage statistics, because information is obtained from the persons concerned and, being a legal act, the registration of marriage is apt to be performed correctly. However, in some countries, there appears to be an abnormal concentration of marriages at the minimum marriageable age and at the age at which valid marriage may be contracted without parental consent, indicating perhaps an overstatement in some cases to comply with the law. Factors which may influence age reporting particularly at older ages include an inclination to understate the bride's age in order that it may be equal to or less than that of the groom.

Inter-area comparability of the frequencies at the lower ages, i.e., up to 24 years, may also be limited by the variation in the minimum legal age for marriage. Information is not available for all countries but it would appear that the marked international variability in rates at these ages is due not so much to differences in patterns of nuptiality but to national variations in the legal requirements for entering into a valid civil marriage contract. The inclusion in the table of the minimum marriageable ages for a number of countries should be useful in investigating this point.

Limitations implied by the code of completeness attached to Table 27—but applicable as well to this table—warrant some consideration although, as explained above, the meaning of the codes in connexion with marriage registration is not always clear. The limitations imposed by date-of-registration tabulation procedures can be largely ignored in evaluating data in Table 28.

Table 29

Table 29 is the regular trend table of divorces and crude divorce rates, which this year shows data for each year 1952-1961.

Unless otherwise described, data refer to final dissolutions of marriage by decree of divorce within the present geographic boundaries and among the present-in-area population. They are decrees granted, not persons divorced.

In accordance with the usual practice, the quality code (C, U and . . .) is presented in the first column of the table and, in addition, data believed to be unreliable (incomplete) or of unknown reliability are set in italics rather than roman type. A description of the basis for this quality specification may be found on p. 16.

Coverage: Annual figures are shown for 109 geographic areas. Major countries are included even though recent data are not available; data for sub-national population segments are also included if national figures are lacking. This policy serves to provide information not only on divorce incidence but on the practices of countries in respect of compiling divorce statistics. Areas where there is no legal provision for divorce are noted in the table.

Rate computation: Rates in Table 29 are the number of divorce decrees granted per 1,000 persons present in the same area at the mid-point of the year in question. In a few cases, a census figure or an estimate for some other date within the year is used for lack of a midyear value. The populations, midyear or other, are official figures and usually those presented in Table 4.

Limitations: Comparability of divorce statistics is limited by several of the factors described in connexion with vital statistics in general and divorce statistics in particular (see pp. 16 and 21). Statistics of divorces may in fact include annulments and/or legal separations, depending on the classification and tabulation procedures employed. If divorces are few, statistics will probably not be available separately.

Since divorce statistics originate in court records and procedures, the marked year-to-year fluctuations are likely to reflect court delays and clearances rather than trends in divorce incidence. Moreover, they tend to reflect also the ability of persons to acquire a divorce, including the laxness or stringency of the grounds on which divorce can be granted and the ability to meet financial and other costs of the court procedures. Connected with this aspect is the influence of certain religious faiths on the incidence of divorce. For all these reasons, divorce statistics are not strictly comparable as measures of family dissolution by legal means.

The effect of completeness on divorce statistics depends to a large extent on the type of the statistics; for a detailed discussion of this aspect, see the 1958 *Demographic Yearbook,* p. 19.

Divorce rates as comparable indices over space or time have the same limitations as any crude rates. Comparability of the basic data is limited by national differences in definitions and concepts due to the legal variations reviewed above. Regulations governing divorce procedures, and variations in the type of data to which divorce sta-

tistics relate, are other sources of noncomparability. For example, inclusion of annulments in the numerator of the rates produces a negligible effect, but inclusion of legal separations may have a measurable effect on the level of the rate.

Crude rates of divorce—like corresponding crude birth, death and marriage rates—are not probability indices. They are rather indicators of the gross additions to the marriageable population and deletions from the married segment; in that capacity, they are extremely useful even though not strictly comparable from area to area. But because of basic differences in the marital status and age composition of populations, they do not measure the risk of divorce among married persons or couples. They give only a general idea of the trends over time and the gross differences between countries in levels of divorce in the total population, limited always by the international variations in the meaning of the term "divorce".

CHAPITRE 1. NOTES SUR LES METHODES D'EVALUATION DE LA FIABILITE DES STATISTIQUES CLASSIQUES DE LA MORTALITE

I. INTRODUCTION

Le rôle des statistiques de la mortalité dans la planification et l'exécution des programmes de santé publique et leur rôle, plus important encore dans l'analyse et la projection des tendances de la population qui servent de base à l'orientation et à la planification des activités dans nombre de domaines économiques et sociaux, montre combien il est nécessaire que ces statistiques soient fiables. Comme, pour établir des statistiques fiables, il faut d'abord en reconnaître le besoin, il peut être utile de passer en revue les sources possibles d'erreurs dans les statistiques de la mortalité ainsi que certaines des méthodes éprouvées par lesquelles on peut mesurer les effets de ces erreurs; ces observations ne s'appliquent qu'aux statistiques de la mortalité générale et infantile; les statistiques des morts fœtales ne peuvent être évaluées par les méthodes indiquées ci-après.

Les statistiques classiques de la mortalité sont fondées sur les données d'enregistrement. C'est-à-dire qu'elles sont établies sur la base des renseignements notés par l'officier de l'état civil et fournis par l'enquêté. En d'autres termes, cette méthode de rassemblement des données implique une rencontre en un lieu central entre l'officier de l'état civil qui y est installé et l'enquêté qui s'y rend et répond à ses questions; elle s'oppose à la technique de l'agent recenseur ou de l'enquêteur, qui prend ses renseignements au domicile de l'enquêté, c'est-à-dire à la méthode du dénombrement, du recensement ou de l'enquête. Malgré cette différence fondamentale de technique, les statistiques de la mortalité sont exposées aux mêmes sources fondamentales d'erreurs que les statistiques du dénombrement: inexactitudes quantitatives, ou erreurs de portée, et erreurs qualitatives, ou inexactitude des déclarations faites en réponse à certaines questions. Les erreurs quantitatives seront examinées d'abord.

II. MESURES DE L'EXACTITUDE QUANTITATIVE DES STATISTIQUES DE LA MORTALITE

Les inexactitudes quantitatives, ou erreurs de complétude dans la portée des statistiques traditionnelles de la mortalité sont, en général, des erreurs de sous-enregistrement. On peut affirmer presque catégoriquement que les chances d'inflation, ou sur-enregistrement, sont, dans le cas des statistiques de la mortalité, à peu près inexistantes. Le double enregistrement est théoriquement possible, mais, en réalité, très improbable, sauf sur le plan international, c'est-à-dire si un décès, enregistré dans le pays où il se produit, est également enregistré dans le pays de résidence habituelle. Toutefois, le nombre possible de ces doubles enregistrements est si faible par rapport à l'ensemble de l'univers considéré que l'on peut sans hésiter négliger cette source d'erreur.

Ce sont les erreurs par omission qui constituent le vrai problème. Le sous-enregistrement résulte essentiellement du fait que la personne qui est censée faire la déclaration de décès ne la fait pas ou ne communique pas la preuve du décès à l'officier de l'état civil. Comme l'enregistrement d'un décès ne procure aucun avantage au déclarant, sauf en cas d'héritage, et peut même, dans certains cas, desservir ses intérêts économiques, en entraînant, par exemple, la suppression de certaines prestations, il peut avoir tendance, si la possibilité lui en est offerte, à négliger cette formalité. Le cas peut se produire pour les décès à tous les âges, mais surtout, naturellement, pour les décès de moins de 1 an. Il arrive souvent que les décès d'enfants survenus dans les premiers jours qui ont suivi leur naissance ne soient pas enregistrés, tout comme il arrive également que les jeunes enfants ne soient pas dénombrés lors du recensement de la population. L'omission est naturellement plus fréquente dans les régions rurales, où l'on peut plus facilement que dans les villes disposer du corps comme on l'entend. De même, elle est d'autant plus fréquente que la société est moins organisée, et que, par conséquent, les autorités administratives sont moins vigilantes.

Il ne faut pas sous-estimer non plus la part de responsabilité qui revient à l'officier de l'état civil dans le sous-enregistrement des décès. En effet, ce dernier est tenu par la loi de se tenir au courant de tous les faits d'état civil et de les enregistrer. Il a le droit de prendre toutes mesures nécessaires pour assurer un enregistrement complet. Malheureusement, la situation de l'officier de l'état civil dans l'administration est généralement telle qu'il est soit incompétent pour prendre les mesures qui permettraient d'améliorer la complétude de l'enregistrement, soit trop occupé pour pouvoir faire l'effort nécessaire. Au surplus, il arrive souvent qu'en raison d'une mauvaise organisation administrative, le bureau de l'état civil est mal situé par rapport au domicile des déclarants éventuels, ce qui augmente les chances de sous-enregistrement.

Le dépistage du sous-enregistrement dans les données sur la mortalité et l'évaluation de l'importance des erreurs par omission ou, au contraire, de la complétude de l'enregistrement, peuvent être assurés de deux manières que l'on pourrait, pour simplifier, désigner sous le nom de méthodes directe et indirecte. La méthode directe, la plus importante, consiste à comparer les inscriptions portées sur le registre des décès aux données obtenues d'une autre source, indépendante, afin de découvrir les lacunes. Cette méthode est analogue au contrôle direct, après le recensement, de la population recensée, où une série de données indépendantes, plus exactes que les premières et permettant, par conséquent, de les compléter sont rassemblées. La méthode indirecte par laquelle on peut déceler les omissions et, éventuellement, en évaluer l'importance, est la procédure analytique, qui consiste à examiner les données statistiques obtenues à partir des renseignements inscrits sur les registres, du point de vue de la plausibilité, à les comparer aux chiffres d'une autre période ou d'une région géographique analogue, afin de voir s'ils concordent, à étudier la concordance interne des répartitions afin de déterminer si elles sont conformes aux rapports classiques que l'on sait exister entre les diverses caractéristiques de la mortalité pour un même univers, ou à les comparer à un modèle théorique. Pour évaluer les statistiques de la mortalité, il faudrait, dans toutes la mesure possible, recourir à l'une et à l'autre de ces deux méthodes; du reste, en principe, l'évaluation indirecte doit être utilisée dans toute analyse qui peut être faite. Comme les méthodes indirectes, qui reposent sur l'examen des données exploitées et des nombres relatifs, sont celles qui permettent une première évaluation approximative, elles seront examinées d'abord.

EXAMEN DES STATISTIQUES (MÉTHODE INDIRECTE)

On peut se faire une idée de la fiabilité des statistiques de la mortalité en examinant les tabulations, afin de voir dans quelle mesure elles correspondent aux normes préétablies, fondées sur l'analyse démographique de statistiques considérées comme complètes et fiables. L'examen des fréquences et du niveau des taux de mortalité du point de vue de la plausibilité donnera une première orientation; la concordance, ou l'absence de concordance, interne des répartitions fournira une autre indication utile; la comparaison des structures que présentent les fréquences et des taux avec les configurations attendues pourra être révélatrice.

Concordance des totaux: La méthode la plus simple consiste à comparer les tabulations des fréquences totales, calculées d'après les données du registre des décès de l'année en cours, avec les chiffres correspondants pour une année antérieure récente. A moins d'une épidémie ou d'une autre catastrophe, qui expliqueraient une mortalité excessive, ou d'importants mouvements migratoires qui auraient eu pour effet d'accroître ou de diminuer l'incidence de la mortalité, le nombre total des décès déclarés pour une année (ou pour une partie d'une année) devrait être à peu près du même ordre de grandeur que le nombre déclaré pour l'année précédente (ou pour la période précédente). Ce type d'analyse est particulièrement indiqué pour les données qui se rapportent à des régions géographiques peu étendues.

Le rapport entre le nombre des décès et des naissances déclarés pour la même région et la même période peut aussi donner une indication précieuse. Ce rapport varie assez considérablement entre les pays, mais, pour le même pays, il devrait être relativement constant, dans le temps et dans l'espace. Aussi, un indice stable révèle-t-il, en principe, un certain degré de fiabilité.

A un niveau un peu plus complexe, on peut évaluer l'exactitude du chiffre total des décès déclarés pendant une période intercensitaire, en utilisant les résultats de deux recensements de population successifs pour estimer la mortalité. Cette technique, connue sous le nom de "méthode de l'équation de concordance", repose sur le fait que les personnes ayant dépassé un âge déterminé à un recensement récent, étaient vivantes lors du recensement précédent et plus jeunes d'autant d'années qu'il s'en est écoulé entre les deux recensements. Comme le dénombrement des jeunes enfants est souvent déficient et comme il importe d'éliminer les erreurs possibles dans le facteur "naissances", il est préférable de ne tenir compte que de la population qui avait, à l'origine, 5 ans et plus. La différence entre les deux recensements, dans la cohorte de population choisie, devrait ainsi être égale au nombre de décès survenus dans le groupe d'âge entre les deux dates, diminuée du nombre d'immigrants et augmentée du nombre d'émigrants de ce groupe d'âge. S'il y a une grande différence entre la diminution révélée par le dénombrement et le chiffre obtenu sur la base des décès enregistrés et des mouvements migratoires, de nouvelles recherches sont nécessaires. Il faudra, par exemple, obtenir des renseignements sur la complétude du dénombrement lors des deux recensements et sur l'exactitude des statistiques des migrations; mais même si l'on n'a pas la preuve de la complétude du recensement, on peut présumer que l'erreur est due surtout aux lacunes de l'enregistrement des décès[1].

Concordance interne de la structure par âge et par sexe: Le degré de concordance interne de la répartition statistique de la mortalité est également un point de départ utile pour évaluer sa fiabilité. Ainsi, lorsqu'une population comprend à peu près le même nombre d'hommes et de femmes, et à condition qu'aucun élément perturbateur étranger, tel qu'une guerre, n'intervienne, le nombre total des décès du sexe masculin devrait être légèrement supérieur au nombre des décès du sexe féminin. Le niveau exact du rapport des sexes pour les décès à tous les âges dépend de divers facteurs, mais on devrait au moins pouvoir s'attendre à obtenir des indices bruts assez semblables pour les diverses subdivisions géographiques d'un même pays. Des divergences sensibles dans le temps ou dans l'espace indiquent qu'il y a lieu d'examiner de plus près si les décès ou les naissances ont fait l'objet d'un enregistrement complet.

Il convient également d'examiner les différences d'âge dans le rapport des décès selon le sexe. En général, il y a plus de décès du sexe masculin que de décès du sexe féminin dans la petite enfance, l'enfance et l'adolescence. Pendant la durée de l'âge de procréation, les décès du sexe

[1] On trouvera des détails complémentaires et des exemples de l'application de la méthode dans l'étude intitulée *Evaluation de la qualité des statistiques de base utilisées pour les estimations de la population*. Deuxième manuel. ST/SOA/Ser.A/23 (Publication des Nations Unies, No de vente: 1956.XIII.2), p. 29-31. Voir également *Utilisation des statistiques de recensement pour le calcul des tables de survie et autres données démographiques*. ST/SOA/Ser.A/7 (Publication des Nations Unies, No de vente: 1950.XIII.3).

féminin peuvent dépasser ceux du sexe masculin, mais plus tard il en est toujours ainsi. Toutes variations géographiques sensibles par rapport à cette structure de la mortalité, toutes fluctuations marquées dans le temps des divers rapports d'âge et de sexe, enfin tout changement de niveau soudain entre les rapports pour les différents groupes d'âge, sont vraisemblablement l'indice d'irrégularités dans l'enregistrement ou dans les déclarations d'âge[2].

Pour ce qui est de la mortalité infantile, on constate que, lorsqu'elle est élevée, le rapport des sexes est généralement de l'ordre de 110-120 décès du sexe masculin pour 100 décès du sexe féminin. Des rapports de masculinité de l'ordre de 130-140 pour 100 s'accompagnent généralement d'un faible taux de mortalité infantile. Des variations marquées ou persistantes par rapport à ce schéma général indiquent probablement des omissions dans l'enregistrement des décès de moins de 1 an.

Comme on suppose que les lacunes de l'enregistrement des décès sont peut-être plus graves pour les décès d'enfants de moins d'un an que pour les personnes plus agées, l'étude du rapport de la mortalité infantile à la mortalité totale peut donner des résultats utiles. Le pourcentage des décès de moins de 1 an par rapport aux décès à tous les âges est relativement stable pour une même région. Entre les pays à faibles mortalité et fécondité et les pays à mortalité et fécondité élevées, le rapport peut varier de 15 à 30 pour 100, mais il ne devrait guère varier d'une région à l'autre, à l'intérieur d'un même pays, ni accuser de fluctuations marquées dans le temps pour un même pays. L'instabilité du rapport indique donc vraisemblablement que l'enregistrement des décès est particulièrement déficient dans le cas des enfants de moins de 1 an.

L'examen de la répartition des décès de moins de 1 an par mois d'âge peut également révéler quels sont les décès qui ne sont généralement pas consignés dans les registres. On sait que la mortalité infantile est particulièrement élevée pendant les premiers jours qui suivent la naissance et que, dans la plupart des pays, elle diminue régulièrement et continuellement pendant les semaines et les mois suivants. Comme la répartition des décès pendant la première année de vie s'ordonne selon un schéma précis suivant le temps, bien qu'à des niveaux variables, toutes divergences marquées par rapport à ce schéma indiquent probablement que les décès pour certains groupes d'âges ne sont pas enregistrés aussi complètement qu'ils devraient l'être. Ces erreurs seront apparentes à la lecture des chiffres absolus, sans qu'il soit nécessaire de se reporter aux taux, comme il faut le faire dans le cas de la mortalité générale selon l'âge.

Fiabilité des taux: Les rapports de fréquences qui pourraient révéler des lacunes dans l'enregistrement des décès ont été indiqués plus haut. Si l'on divise ces chiffres absolus par le chiffre de la population du groupe correspondant, d'autres indicateurs utiles concernant les lacunes probables de l'enregistrement peuvent apparaître. Le premier est le taux brut de mortalité générale.

Les taux bruts de mortalité fondés sur des statistiques exactes sont rarement inférieurs à 8 décès pour 1 000, à moins que la répartition par âge de la population intéressée ne soit atypique. Ainsi, le taux brut de mortalité parmi la population juive d'Israël était, en 1959, de 5,5 pour 1 000, alors que le taux dans d'autres pays ayant atteint un degré de développement économique comparable et où l'enregistrement est considéré comme complet, était bien supérieur. Mais la population juive d'Israël est surtout composée de jeunes, parmi lesquels la mortalité est faible; donc, comme le taux brut est une moyenne pondérée des taux selon l'âge, il est plus faible qu'il ne le serait dans le cas d'une population tout aussi saine, mais plus âgée. Si un taux brut de mortalité très faible persiste dans une population dont la répartition par âge n'est pas anormale, il y a lieu de penser, soit que des décès ont été omis, soit que les données de base relatives à la population ne sont pas fiables.

Toutes choses égales d'ailleurs, les taux bruts de mortalité concernant la population des subdivisions géographiques d'un pays ou territoire ne devraient pas présenter des écarts considérables. Dans ces conditions, l'examen des différences existant dans la structure géographique des taux devrait permettre de déterminer les subdivisions où un sous-enregistrement excessif des décès risque de s'être produit. Cette analyse de la fiabilité devrait naturellement s'accompagner d'un examen simultané de l'exactitude des données démographiques servant au calcul des taux. Il faudrait s'efforcer d'évaluer la stabilité dans le temps de la structure géographique des taux ainsi que les conséquences qui en résultent pour la fiabilité probable de la moyenne concernant le pays intéressé.

Un autre rapport peut avoir aussi son importance. Un faible taux de mortalité s'accompagne généralement d'un faible taux de natalité. Un taux de mortalité de 10 à 15 pour 1 000 va normalement de pair avec un taux de natalité de 15 à 25 pour 1 000. Si le taux de mortalité qui accompagne un faible taux de natalité est, soit extrêmement faible, soit anormalement élevé, l'exactitude des statistiques de base de la mortalité peut être mise en doute. Dans une étude de la structure des variations géographiques des taux à l'intérieur d'un pays, la corrélation entre les faibles taux de mortalité et les faibles taux de natalité donne d'utiles avertissements.

Les différences entre les taux de mortalité selon l'âge et l'état matrimonial offrent également un moyen d'évaluer les taux observés. Les taux de mortalité parmi les personnes mariées sont généralement plus faibles que parmi les célibataires, les veufs et les divorcés. Ce phénomène se vérifie tant pour le sexe masculin que pour le sexe féminin et pour tous les âges. Toutes divergences par rapport à ces normes indiquent qu'il convient d'examiner de plus près le numérateur et le dénominateur des taux.

L'étude de la répartition des taux de mortalité selon l'âge et le sexe offre peut-être le meilleur moyen de trouver les lacunes possibles. D'abord, les taux de mortalité selon l'âge sont généralement plus élevés pour le sexe masculin que pour le sexe féminin à tous les âges, à moins que la mortalité maternelle ne soit très élevée dans la population ou qu'une maladie mortelle, atteignant exclusivement les femmes, ne se manifeste. Ensuite, pour ce qui est de la mortalité aux différents âges, elle est invariablement beaucoup plus élevée au-dessous d'un an qu'à tout autre âge de la vie. A partir de ce maximum atteint dans la petite enfance, les taux de mortalité baissent régulièrement jusqu'à un minimum entre 10 et 14 ans, pour remonter ensuite, régulièrement, continuellement et rapidement, ce qui donne une représentation graphique ayant la forme d'un U. Toutes déviations par rapport à cette

[2] Voir également page 53.

structure type: excédent de la mortalité du sexe masculin et courbe en U, appellent des explications spéciales (risques auxquels la population a été exposée, causes de décès ou sous-enregistrement).

La courbe du taux de mortalité infantile est d'un dessin analogue à celle qui figure les chiffres absolus, car chaque taux selon l'âge est calculé pour le même nombre de naissances vivantes, de sorte qu'il s'agit en réalité d'un rapport, plutôt que d'un taux au sens probabiliste du terme. Comme on l'a dit, la mortalité atteint généralement son point culminant à l'âge le plus jeune et diminue ensuite progressivement. Si l'on s'écarte de cette courbe qui a la forme du premier jambage de l'U, on peut en déduire soit qu'il y a sous-enregistrement des décès soit que les déclarations d'âge pour les très jeunes enfants sont inexactes.

Le taux absolu de mortalité infantile ne constitue pas, à lui seul, un indice utile de sous-enregistrement des décès de nourrissons, car il peut varier aussi selon la complétude de l'enregistrement des naissances vivantes qui forment le dénominateur du taux. Toutefois, dans l'ensemble, le taux de mortalité infantile devrait concorder avec les taux selon l'âge et leur moyenne pondérée: le taux brut de mortalité. En partant de ce rapport, le Service de la population de la Direction des affaires sociales de l'ONU a fait la synthèse, sous la forme de tables de mortalité types, des variations par âge de la mortalité, d'après les tables de mortalité de 50 pays pour la période de 1900 à 1950[3]. Cette série de 40 tableaux représentant tous les degrés de la mortalité depuis le niveau le plus faible jusqu'au plus élevé, examine toute la gamme des variations de la mortalité dans le monte entier à intervalles réguliers et montre le rapport moyen entre la mortalité pour chaque sexe aux différents groupes d'âge pour un groupe de pays ayant des taux de mortalité différents. Lorsque les quotients de mortalité observés dans un pays déterminé sont comparés avec ceux de la table type qui s'en rapproche le plus — en ce qui concerne la mortalité infantile ou la mortalité ou cours de l'enfance par exemple — les variations indiquent des inexactitudes possibles dans les données de base. En d'autres termes, les tables types peuvent être utilisées pour vérifier l'exactitude des taux de mortalité selon l'âge et le sexe dont on dispose.

Les tables types ont été utilisées à cette fin pour le Costa Rica, le Salvador et le Guatemala notamment, et l'on a comparé les quotients de mortalité infantile pour 1950 aux données correspondantes des tables types. Ainsi, pour le Costa Rica, on a comparé le quotient de mortalité infantile pour les deux sexes pour 1950 à la valeur moyenne des tables types Nos 16 et 17; pour le Salvador, la comparaison a été faite avec les tables types 15 et 16, et pour le Guatemala avec les tables types 17 et 18. La comparaison a montré que dans le cas du Costa Rica les différences au-dessus de cinq ans étaient aussi faibles qu'on pouvait s'y attendre. En revanche, dans le groupe d'âge de 1-4 ans, la mortalité paraît trop élevée par rapport à la mortalité infantile; ce rapport peut être dû soit au sous-enregistrement des décès de nouveau-nés, soit à des erreurs par excès dans les déclarations de naissances, soit encore à l'inflation du taux de mortalité pour le groupe d'âge de 1-4 ans, résultant peut-être d'un dénombrement incomplet de la population de ce groupe d'âge lors du recensement.

Pour le Guatemala et le Salvador les différences sont systématiques, ce qui peut indiquer que les taux de mortalité infantile figurant dans la table de mortalité sont beaucoup trop faibles par rapport à la mortalité pour d'autres groupes d'âges. Pareilles anomalies appellent des vérifications plus poussées.

COMPARAISON AVEC D'AUTRES DONNÉES (MÉTHODE DIRECTE)

Les diverses méthodes indirectes ou analytiques par lesquelles on s'efforce de déceler le sous-enregistrement des décès permettent de constater s'il existe des différences entre les prévisions et la réalité. Le but de la méthode directe est de préciser le genre de décès qui ne sont pas enregistrés et d'en mesurer le nombre. C'est cette méthode qui permet d'envisager des remèdes. Le contrôle indirect peut révéler l'existence de lacunes et leur portée, mais les méthodes indirectes ne peuvent permettre ni de retrouver les faits que l'on a laissé échapper ni de compléter théoriquement les données des registres. Elles ne peuvent pas, non plus, indiquer dans quelles régions géographiques ou dans quels groupes de population le sous-enregistrement des décès est le plus grave.

La première condition requise pour l'utilisation de la méthode de contrôle direct est l'existence d'une deuxième liste de décès. Par définition, aucune source accessoire de renseignements sur les décès ne devrait être plus complète que le registre officiel, mais, selon sa nature, chaque liste supplémentaire peut comprendre des renseignements différents. Ainsi, toute liste relativement complète des décès, établie à des fins autres que l'enregistrement, peut utilement servir au contrôle du registre officiel, et la liste la plus normale à consulter est évidemment celle des inhumations dans les cimetières.

Listes des cimetières: Pour des raisons légales et sanitaires d'abord, mais aussi, accessoirement, pour assurer la complétude de l'enregistrement des décès, la plupart des législations disposent que, pour obtenir l'autorisation d'inhumer ou d'incinérer un cadavre, il faut auparavant avoir fait enregistrer le décès dans le registre officiel et obtenu un certificat de décès. Cette disposition repose sur le droit, et même le devoir, de l'Etat de connaître le fait du décès et sa cause, afin de déterminer s'il s'agit d'une cause naturelle ou, par exemple, d'un acte criminel justifiant l'intervention de la police pour protéger les droits des citoyens. Cette disposition doit donc prévoir l'enregistrement de tous les décès, qu'ils soient dus à des causes naturelles ou à des actes criminels. Cependant, il semble que dans certaines régions du monde, cette disposition ne soit pas toujours respectée. On sait que les nourrissons, surtout s'ils meurent à la campagne, ne sont pas toujours inhumés dans un cimetière agréé et que, même dans le cas des adultes, l'inhumation est parfois assurée par les soins d'une organisation religieuse ou privée, sans l'intervention des autorités civiles. Aussi, les listes des cimetières ou autres lieux d'inhumation offrent-ils le moyen de contrôle le plus accessible, surtout dans les régions urbaines, et les noms qui y sont inscrits mais qui ne figurent pas sur le registre officiel des décès permettent-ils de se faire une idée de la nature et de l'importance des lacunes de ce dernier.

[3] *Schémas de variation de la mortalité selon l'âge et le sexe, Tables types de mortalité pour les pays sous-développés.* ST/SOA/Ser.A/22. (Publication des Nations Unies, No de vente 1955.XIII.9).

Registres des déclarations de décès: Une deuxième liste des décès, qui n'est évidemment pas complète, mais qui peut être indépendante, est le registre des déclarations de décès. Dans beaucoup de pays, il est prévu que le médecin qui a soigné le défunt ou a examiné le cadavre ou l'administration de l'hôpital où le décès a eu lieu notifie le décès à l'officier de l'état civil. Cette obligation est souvent limitée aux décès consécutifs à une maladie contagieuse et s'ajoute à l'obligation du médecin d'indiquer la cause du décès sur le certificat médical (voir p. 15). Ainsi, la déclaration du médecin traitant permet d'établir une deuxième liste des décès et, en confrontant le registre des décès avec cette liste, on peut retrouver des faits qui n'ont pas été enregistrés officiellement. En recourant à ce moyen, tout comme aux listes des cimetières, on obtient une simple indication des lacunes de l'enregistrement, non une évaluation générale. Cette technique, qui permet d'améliorer la complétude des données, est généralement appliquée automatiquement chaque fois que l'on dispose de deux séries de renseignements. Comme la déclaration de décès est également obligatoire, les décès enregistrés qui n'ont pas été déclarés montrent aussi dans quelle mesure les médecins s'acquittent de leurs obligations.

Données obtenues à partir d'enquêtes sur la population: Les listes des cimetières et les déclarations des médecins sont des documents administratifs, liés d'une certaine manière au registre des décès. Une liste des décès complètement indépendante du registre officiel peut être établie par le système de l'enquête auprès des ménages. Cette enquête rétrospective peut porter sur toute la population résidant dans un pays, sur les habitants d'une subdivision administrative déterminée ou sur un échantillon représentatif de la région ou de la population tout entière. Le système consiste à demander, dans chaque ménage d'une région donnée, s'il y a eu un décès depuis une certaine date et à prendre, au sujet de la personne décédée, des renseignements suffisamment précis pour que l'on puisse, le cas échéant, retrouver la mention sur le registre des décès. La liste ainsi établie est ensuite confrontée, nom pour nom, avec le registre des décès.

L'enquête rétrospective fournit, pour les statistiques des décès, le même moyen de contrôle que l'enquête post-censitaire pour les dénombrements de la population. Dans les deux cas, la comparaison des deux listes indépendantes permettra de classer les faits en quatre catégories: 1) décès figurant sur les deux listes; 2) décès figurant sur le registre des décès, mais non sur la liste des enquêteurs; 3) décès figurant sur la liste des enquêteurs, mais non sur le registre des décès; 4) enfin, un groupe hypothétique de décès ne figurant nulle part. Pour des raisons pratiques, on supposera que le quatrième groupe sera extrêmement restreint et que le troisième donnera une idée assez exacte des lacunes du registre des décès. C'est l'analyse de ce groupe qui permettra d'évaluer l'importance du sous-enregistrement et de voir quels remèdes il y aurait lieu d'y apporter. L'analyse du deuxième groupe de données (décès figurant sur le registre des décès, mais non sur la liste des enquêteurs) permettra d'apprécier la précision de la méthode d'enquête.

Malgré sa simplicité apparente, le système de l'enquête, qui permet d'établir une liste indépendante des décès que l'on peut comparer au registre, est exposé à de nombreuses erreurs. Ses principaux inconvénients sont ceux de toute enquête dans les ménages, c'est-à-dire que ses résultats dépendent 1) de la volonté de l'enquêté de fournir les renseignements demandés, 2) de sa connaissance des faits et 3) de la fidélité de sa mémoire qui doit être suffisante pour situer correctement l'événement dans le temps et dans l'espace.

La volonté de révéler les faits est un élément particulièrement important dans le cas des enquêtes sur les décès. On a reconnu depuis longtemps que, même dans les sociétés modernes, les enquêtés répugnent à parler des décès survenus dans leur ménage ou à en communiquer les détails, de sorte que l'on peut s'attendre à des omissions délibérées. De petites enquêtes, menées à titre expérimental dans des pays industriels, ont paru contredire cette théorie, mais on ne saurait nier que, dans des sociétés plus primitives, des superstitions bien enracinées empêcheront sans doute de révéler des décès, surtout s'il s'agit de décès de jeunes enfants auxquels on n'avait pas encore donné de nom. C'est une des raisons pour lesquelles la liste des décès établie par la méthode de l'enquête risque de n'être qu'une liste partielle, comme le montrent les faibles taux de mortalité obtenus sur la base de ces données dans des pays où l'enregistrement officiel des décès n'existe pas encore.

Toutefois, il est probable que s'il existe une certaine hésitation à parler d'un décès l'événement en question n'aura pas été déclaré aux autorités compétentes. En conséquence, cet inconvénient particulier de la méthode des enquêtes permet de penser que ce procédé donne de moins bons résultats dans le cas de la mesure de niveau de la mortalité en l'absence de registres d'état civil que dans celui de la vérification de la complétude des registres des décès. Il est probable que les décès non déclarés seront compris dans le quatrième groupe hypothétique "non déclarés et non enregistrés" mentionné plus haut qui peut être plus important par rapport à l'ensemble qu'on ne le suppose généralement. Malheureusement, il n'existe pas de méthode absolument sûre permettant d'en évaluer l'importance[4].

Même si l'enquêté accepte volontiers de parler d'un décès, le succès de l'enquête dépend du souvenir qu'il en a et de l'exactitude de la date et du lieu où il le place. Il est probablement vrai que la plupart des lacunes des enquêtes s'expliquent par des défaillances de mémoire. L'un des remèdes pourrait être de raccourcir la période sur laquelle faire porter l'enquête, mais lorsqu'on fait un sondage par la méthode du porte à porte sur la mortalité, il faut nécessairement soit agrandir exagérément l'échantillon, soit allonger la période considérée si l'on veut examiner un nombre suffisant de décès. L'élargissement de l'échantillon augmente les dépenses; la prolongation de la période considérée augmente les erreurs de mémoire et diminue la précision.

Un plus grave inconvénient de l'enquête sur les ménages pour mesurer la complétude ou déterminer les niveaux de mortalité est que souvent le décès d'un individu élimine le ménage qu'il constituait à lui seul, et qu'il ne reste personne pour témoigner des circonstances qui ont entouré ce décès. Une enquête dans les ménages ne pourrait donc pas révéler qu'un tel décès a eu lieu; s'il n'a pas été enregistré non plus il n'y aura aucun moyen d'en être informé.

---

[4] Pour des renseignements plus détaillés sur cette méthode, voir *Evaluation de la qualité des statistiques de base utilisées pour les estimations de la population, Deuxième manuel, op. cit.*, p. 34-35.

L'impossibilité de déterminer correctement la date du décès ne constitue pas un obstacle insurmontable à l'utilisation de cette méthode aux fins de vérifications. Il sera simplement plus difficile de retrouver l'événement dans le registre des décès et si l'on mesure le niveau de la mortalité sur la base des renseignements recueillis au cours de l'enquête sur les décès le taux correspondant à la période à laquelle les décès ont été indûment affectés risque également d'être entaché d'une erreur par excès. Mais un problème beaucoup plus grave se pose lorsque l'enquête ne permet pas de déterminer correctement le lieu du décès. Dans une enquête sur la mortalité, le déclarant doit donner des renseignements sur les décès survenus parmi les personnes résidant avec le ménage, tandis que sur le registre de l'état civil sont consignés les décès survenus dans la circonscription considérée, indépendamment du domicile du décédé. L'impossibilité d'avoir des renseignements sur le lieu des décès au sujet desquels on a pu recueillir des précisions au cours de l'enquête risque d'entraîner des recherches inutiles dans le registre et par conséquent une erreur par défaut dans l'estimation du degré de complétude de l'enregistrement; en effet, si un décès est survenu hors du ressort du service de l'état civil dont les registres sont examinés, il a normalement dû être enregistré dans un autre ressort. De même, si l'enquête ne permet pas de faire correspondre un décès à chacun des décès mentionnés dans le registre, c'est peut-être parce que le décédé ne résidait pas ou n'avait pas résidé auparavant dans la circonscription considérée. Dans les deux cas, on est amené à douter dans une certaine mesure, de l'utilité de la méthode de la correspondance des noms en ce qui concerne la mesure de la complétude quantitative des données figurant dans le registre des décès.

III. MESURES DE LA VALEUR QUALITATIVE DES DONNEES

Dans les sections précédentes du présent chapitre, on a étudié les méthodes permettant de déceler et, dans une certaine mesure, d'évaluer le sous-enregistrement, les lacunes existant dans la portée ou les omissions faussant les statistiques de la mortalité. On a décrit la méthode directe qui est utilisée pour déceler les événements omis et les compter — on compare une à une les mentions figurant sur les actes de décès et sur les bulletins de décès qui sont rassemblés indépendamment les uns des autres; en outre, on a expliqué que les irrégularités existant dans les statistiques de la mortalité sont l'indice indirect des erreurs éventuellement commises dans l'enregistrement des décès.

Les paragraphes ci-après sont consacrés à un autre aspect de l'évaluation des statistiques de la mortalité, à savoir la mesure de la valeur qualitative des statistiques concernant les caractéristiques ou les particularités individuelles des décédés. L'étude des erreurs pouvant être commises au moment de la déclaration, de l'enregistrement et du dépouillement des données concernant les décès — et l'analyse visant à en déterminer l'origine — montrent qu'il s'agit essentiellement d'erreurs de déclaration qui sont généralement dues à l'un des facteurs ci-après: 1) le déclarant ne possédait pas les renseignements voulus sur le décédé; 2) le déclarant ou l'officier de l'état civil n'avait pas compris ou n'avait pas suivi attentivement les instructions concernant l'enregistrement des données; 3) le déclarant avait refusé de répondre à une question; 4) l'officier de l'état civil n'avait pas posé la question voulue au déclarant. Une cinquième possibilité est que les données n'aient pas été dépouillées selon une méthode uniforme.

Les erreurs de déclaration ont pour effet de fausser la répartition statistique des décès selon les caractéristiques retenues, ou d'en diminuer la fiabilité; c'est là un des problèmes les plus importants qui se posent lorsqu'on veut utiliser ces statistiques aux fins de l'analyse démographique. Mais il convient de noter que la répartition des décès selon certaines caractéristiques peut également être faussée par le sous-enregistrement. Si les omissions graves ne sont pas uniformément réparties dans le territoire et la population considérés, mais sont plus nombreuses dans certaines zones ou pour les décédés appartenant à un même sexe, ayant un âge déterminé ou possédant un état matrimonial donné, elles se traduisent, dans les séries concernant la caractéristique en cause, par des irrégularités égales à celles qu'entraînent les erreurs de déclaration qui ont été mentionnées plus haut et qui sont décrites ci-après.

En ce qui concerne les statistiques de la mortalité, les caractéristiques pour lesquelles il faut évaluer le degré d'exactitude des déclarations sont celles qui concernent le décès ou le décédé, notamment le sexe, l'âge, l'âge des parents (pour les enfants de moins de 1 an), l'état matrimonial, la date du décès, la profession et la branche d'activité. Il n'existe pas de méthodes de vérification pour chacune de ces caractéristiques, mais pour certaines d'entre elles le procédé à utiliser s'impose de lui-même. Pour chacune de ces caractéristiques, on examinera les méthodes indirectes d'évaluation — qui reposent sur la manipulation statistique des données exploitées — et les méthodes directes — qui sont fondées sur la comparaison des mentions individuelles figurant sur les divers bulletins.

Comparer l'acte de décès à un document antérieurement établi, qui est censé contenir des renseignements exacts sur une ou plusieurs des caractéristiques étudiées ici, semble constituer une méthode très pratique. Toutefois, il convient de souligner que, dans le cas d'une population mobile, il est souvent très difficile de disposer de documents permettant des comparaisons. C'est ainsi que pour fair les études mentionnées à la page 54, lesquelles visaient à évaluer les différences entre les renseignements professionnels et autres figurant 1) sur les bulletins du recensement de la population de 1950, 2) sur les certificats de naissance et de décès des registres d'état civil du Royaume-Uni et 3) sur les bulletins du recensement de 1951 et sur les certificats de décès au Royaume-Uni, on a relevé dans un échantillon établi sur la base des registres de l'état civil les unités correspondant aux personnes auxquelles se rapportaient les bulletins de recensement. Aux Etats-Unis, on n'a pu identifier, dans les bulletins de recensement, que 79 pour 100 des personnes faisant partie de l'échantillon des décédés. L'étude faite au Royaume-Uni ne contient rien de semblable, mais les autres ren-

seignements dont on dispose permettent de penser que le chiffre correspondant est inférieur à 87 pour 100. Cependant, l'étude entreprise aux Etats-Unis a conclu que l'impossibilité de réaliser l'opération en question n'introduit pas une erreur importante dans les relations que l'on peut dégager. En conséquence, cette méthode permet de procéder à une évaluation qualitative sûre.

SEXE

Il est probable que les erreurs sur le sexe des décédés sont très rares; s'il en existe, les autres renseignements figurant dans la déclaration de décès (nom et profession par exemple) permettent souvent de les rectifier. Du fait que ces erreurs sont improbables, on peut supposer que la déclaration concernant cette caractéristique est généralement exacte; les statistiques correspondantes sont sûres. En conséquence, si le rapport du nombre des décès du sexe masculin à celui des décès du sexe féminin s'écarte de la normale, on peut sans risque conclure à un défaut de complétude dans l'enregistrement plutôt qu'à des erreurs dans les déclarations.

AGE

Examen des statistiques: Le moyen le plus simple et le plus direct de déceler les erreurs dans les déclarations d'âge est d'examiner la répartition (en pourcentage) des décès selon l'âge afin de vérifier la proportion des décès d'âge inconnu. Si cette proportion est élevée, on peut avoir des doutes quant à l'exactitude des données concernant chacun des autres groupes d'âge. Ensuite, il faudra soit démontrer que le nombre des décès d'âge inconnu ou la polarisation des décès sur certains groupes d'âge n'est pas suffisante pour fausser l'ensemble de la répartition, soit déterminer dans chaque cas l'âge exact du décédé.

Pour déceler l'existence éventuelle d'erreurs dans les déclarations d'âge et pour localiser ces erreurs, on peut en outre examiner la répartition des décès selon l'âge et le sexe ainsi que l'ensemble des taux de mortalité selon l'âge et le sexe (voir page 49). Si ces statistiques ne coïncident pas avec la structure normale de la mortalité selon l'âge et le sexe, l'écart peut être attribuable à un sous-enregistrement; toutefois, il ne faut pas oublier que les déclarations d'âge peuvent être erronées. En particulier, il faut envisager la possibilité d'une polarisation des déclarations sur les âges se terminant par certains chiffres. Les méthodes utilisées pour évaluer le phénomène de polarisation dans le cas de la répartition de la population selon l'âge peuvent être également appliquées aux statistiques de la mortalité selon l'âge. Elles sont exposées en détail dans *Evaluation de la qualité des statistiques de base utilisées pour les estimations de la population*[5].

Une autre méthode indirecte qui permet de déceler dans les statistiques de la mortalité les erreurs éventuelles concernant l'âge repose sur l'équation de concordance; en d'autres termes, on compare l'effectif d'une cohorte d'âge donné d'un recensement à l'autre. Si la différence entre l'effectif d'une cohorte dénombrée au précédent recensement et l'effectif actuel de la cohorte suivante est supérieure au nombre des décès enregistrés depuis le recensement en question, on pourra incriminer l'une des cinq causes ci-après: 1) émigration importante, 2) portée défectueuse de l'un des deux (ou des deux) recensements, 3) erreurs dans les déclarations d'âge des recensés, 4) défaut de complétude de l'enregistrement des décès et 5) erreurs sur l'âge au moment des décès. On doit envisager chacune de ces possibilités avant de se prononcer sur l'exactitude de l'âge des décédés.

Comparaison avec d'autres documents: La seule manière de vérifier avec précision si l'âge déclaré au moment du décès est exact est de comparer les actes de décès avec des documents établis séparément et contenant la date de la naissance du décédé ou son âge, en années révolues, à une date déterminée. Parmi les documents en question, celui qui a le plus de chances d'être exact est l'acte de naissance correspondant. Il va sans dire que exception faite des pays où il existe un registre permanent de la population résidente offrant toute garantie de fiabilité, les opérations de concordances exigent que l'on connaisse le lieu de naissance du décédé et que l'on fasse des recherches dans le registre des naissances voulu; toutes ces opérations sont très dispendieuses et très compliquées dans le cas d'une population mobile; et pour les décès d'adultes, on ne saurait procéder à des enquêtes exhaustives et répétées. Cependant, on pourrait utiliser la méthode des sondages pour se faire une idée plus exacte de la qualité des déclarations d'âges.

En ce qui concerne la mortalité maternelle et infantile, on pourrait faire, et on fait habituellement, des vérifications de ce genre. Dans la plupart des cas, les registres des naissances nécessaires se trouvent au même bureau de l'état civil que celui des décès et on procède généralement à une contre-vérification pour s'assurer que la naissance a bien été enregistrée. En même temps, on peut vérifier les caractéristiques du décédé. Il convient de souligner que la vérification de la mention concernant l'âge est plus importante dans le cas de décès d'enfants de moins de 1 an que dans celui des décès d'adultes. Ceux-ci sont généralement répartis en groupes d'âge quinquennaux ou décennaux. Comme les erreurs sur l'âge se traduisent par une polarisation des déclarations sur les âges se terminant par les chiffres 0 ou 5, leurs effets se contrebalancent, mais pour les décès de moins de 1 an, les erreurs sont plutôt dues au fait que l'âge n'est pas calculé en unités de temps (heure, jour, semaine et mois), c'est-à-dire par soustraction de la date exacte de la naissance (jour, mois et année) de celle du décès (jour, mois et année). Il se peut que les enfants âgés de moins de 24 heures soient déclarés comme ayant vécu un jour, et que ceux de moins de 1 an soient déclarés comme ayant vécu un an. De plus, il est possible qu'un enfant n'ayant vécu que quelques heures ou même quelques jours soit enregistré comme mort-né et non comme né vivant puis décédé, ce qui entraîne une erreur par défaut dans les données se rapportant à la période qui suit immédiatement la naissance. Dans ces conditions, il importe tout spécialement de comparer les actes de décès des enfants de moins de 1 an avec les actes de naissance correspondants, de manière à vérifier l'âge exact au décès. On peut en même temps vérifier l'âge de la mère.

On peut comparer l'âge mentionné sur les certificats de décès et celui qui figure dans le bulletin de recensement correspondant pour évaluer l'exactitude des déclarations d'âge ayant servi à établir les statistiques de la mortalité. Il faut tenir compte du laps de temps écoulé entre le dénombrement et le décès, mais comme dans bien des cas c'est la date de naissance qui doit être indiquée dans le

[5] *Op. cit.*, p. 47 à 58.

bulletin de recensement, et non l'âge, il se peut que ce délai ne crée pas de difficultés importantes en ce qui concerne l'âge. Par contre, la recherche du bulletin de recensement pertinent risque de poser les problèmes les plus délicats, du point de vue de l'évaluation chronologique, lorsque le recensé a changé de domicile (celui-ci étant entendu selon la définition adoptée aux fins du recensement) entre la date du dénombrement et celle du décès.

On pourrait faire ces recherches pour tous les certificats de décès, mais il est vraisemblable qu'un sondage fournirait les indices d'évaluation nécessaires. L'étude qui a été consacrée, au Royaume-Uni, à l'exactitude des déclarations faites lors du recensement de la population effectué en 1951 illustre l'utilisation que l'on peut faire de cette méthode; la méthode utilisée et les résultats obtenus ont été publiés dans le *General Report*[6]. Dans cette étude, on a essayé de comparer certains renseignements — l'âge notamment — concernant chacun des 9 864 décès enregistrés entre le 1er et le 7 mai 1951 aux données correspondantes figurant dans les bulletins du recensement du 1er avril 1951. On a constaté que c'étaient les déclarations d'âge faites lors de l'enregistrement des décès qui étaient les plus sûres. L'étude faite aux Etats-Unis, laquelle visait principalement à déterminer le degré de comparabilité des renseignements sur la population figurant dans les registres de l'état civil et dans les bulletins du recensement de 1950[7] avait principalement pour but de confronter les déclarations d'âge; bien qu'il ait été difficile d'identifier toutes les personnes comprises dans l'échantillon, la méthode semble avoir donné des résultats utiles.

Etant donné que, en raison des buts auxquels elles répondent, les archives des assurances contiennent habituellement des renseignements exacts sur l'âge ou sur la date de naissance et que le versement des prestations suppose que l'on ait la preuve du décès, il semble que l'on puisse facilement utiliser les archives des assurances sociales pour vérifier l'âge mentionné sur le registre des décès. On pourrait limiter la comparaison aux données concernant un échantillon des décès ouvrant droit aux prestations de la sécurité sociale mais il serait probablement plus facile de créer un système permanent de vérification automatique.

Il existe une autre catégorie de documents indépendants permettant de vérifier l'âge au décès; il s'agit des déclarations de décès qui sont recueillis au cours d'une enquête directe sur les ménages du genre de celle mentionnée plus haut et visant à déterminer le degré de complétude de l'enregistrement. Cependant, l'utilisation des déclarations à des fins de vérification qualitative ne se justifie que s'il y a lieu de penser que les renseignements sur l'âge fournis par l'enquête sont plus sûrs que ceux des registres de décès. Il est concevable qu'au cours d'entrevues prolongées des enquêteurs très expérimentés puissent obtenir, à propos de l'âge, des renseignements plus exacts que ceux que fournit le déclarant à l'officier de l'état civil, mais cela n'est pas certain. Les réponses faites lors de l'enquête risquent de comporter toutes les erreurs inhérentes au rassemblement des données selon la méthode de l'entrevue (à ce propos, voir page 51).

ETAT MATRIMONIAL

Examen des statistiques: Comme dans le cas de la répartition des décès selon l'âge, un pourcentage élevé de décédés dont l'état matrimonial est inconnu est l'indice que les statistiques classées selon cette caractéristique sont peut-être d'une qualité discutable. Dans cette éventualité, il faut considérer que les méthodes d'enregistrement ont pu être défectueuses. Il est par exemple certain que les décédés appartenant à la catégorie en question sont essentiellement de jeunes célibataires qui n'avaient pas eu à fournir de renseignements quant à leur état matrimonial. La répartition par âge devrait aider à élucider ce point.

Comparaison avec d'autres documents: On ne peut vérifier l'exactitude des déclarations relatives à l'état matrimonial des décédés qu'en comparant les renseignements fournis à ceux que l'on peut se procurer ailleurs, ce qui est en fait difficile, car l'état matrimonial peut se modifier très rapidement. Par exemple, pour comparer les déclarations faites lors de l'enregistrement du décès à celles qui ont été recueillies lors du recensement précédent, il faudrait confronter la date de mariage et celle du décès du conjoint ou celle du divorce, de manière à procéder aux ajustements chronologiques voulus. Cependant, d'après les études faites aux Etats-Unis et au Royaume-Uni et mentionnées ci-dessus[8], le taux de correspondance relatif à cette caractéristique est élevé, bien qu'aucun ajustement n'ait été fait pour tenir compte des modifications survenues entre les dates de référence; on a supposé que l'état matrimonial des recensés n'a jamais changé au cours de la période considérée. Il en résulte qu'il est possible de procéder à des vérifications en comparant les mentions portées sur les registres de décès et sur les bulletins des recensements.

Il serait préférable de comparer les données figurant sur les registres de décès aux renseignements fournis par une enquête par sondage de la mortalité effectuée immédiatement après la période au cours de laquelle se sont produits les décès étudiés, car l'enquête peut alors donner des renseignements relativement sûrs. Cependant, ce procédé comporte un grand nombre des défauts inhérents aux méthodes visant à obtenir rétrospectivement des renseignements exacts et on peut sérieusement douter de la fiabilité des données ainsi obtenues.

Peut-être la chose à faire en ce qui concerne cette caractéristique est-elle de s'assurer si les définitions et les méthodes d'exploitation utilisées pour élaborer les statistiques de la mortalité — notamment pour classer les personnes en union consensuelle — sont bien conformes à celles qui sont employées pour établir les chiffres de population servant de base au calcul des taux.

CARACTÉRISTIQUES ÉCONOMIQUES (PROFESSION ET BRANCHE D'ACTIVITÉ)

Comme pour l'état matrimonial, il est préférable de vérifier les données en les comparant aux renseignements figurant sur des documents établis indépendamment; de même, il est difficile de disposer d'une série de documents pouvant servir de base à des comparaisons, en partie à cause du facteur temps.

[8] *The Comparability of Reports on Occupation from Vital Records and the 1950 Census, op. cit.*, p. 24; et *Census 1951, England and Wales; General Report, op. cit.*, p. 43 et 44.

Comparaison avec d'autres documents: Dans les études faites aux Etats-Unis et au Royaume-Uni mentionnées ci-dessus, on a comparé un échantillon des données figurant dans les registres des décès aux renseignements correspondants consignés sur les bulletins de recensement, lesquels constituaient en l'occurrence des documents indépendants[9]. Dans le cas de ces deux études, on a cherché à déterminer dans quelle mesure la profession déclarée au moment de l'enregistrement du décès était celle qui avait été indiquée lors du recensement, afin de savoir s'il est vraiment possible d'analyser la mortalité selon la profession au moyen, aux Etats-Unis, de taux obtenus en rapportant les statistiques des décès classés selon la profession habituelle aux données censitaires concernant la répartition professionnelle de la population. Etant donné les objectifs visés, on a considéré que les données étaient comparables dès lors qu'elles présentaient une assez grande similitude, mais on pourrait utiliser cette méthode pour procéder à des évaluations plus précises.

On pourrait également vérifier l'exactitude des renseignements sur l'activité économique figurant dans le registre des décès au moyen des bulletins établis lors des enquêtes par sondage sur la main-d'œuvre, ces bulletins constituant la deuxième série de documents de référence. Les méthodes utilisées seraient nécessairement les mêmes que dans le cas des bulletins de recensement de la population, mais on pourrait limiter les difficultés en raccourcissant l'intervalle séparant les deux opérations.

Les archives de la sécurité sociale et celles des syndicats pourraient également fournir des données utilisables aux fins de vérification. En raison de leur caractère actuel, ces archives, qui sont davantage à jour, pourraient constituer la source de renseignements la plus efficace et la plus sûre en ce qui concerne la profession et la branche d'activité pour déterminer la précision des registres des décès.

Enquêtes rétrospectives: L'étude faite aux Etats-Unis (voir plus haut) a montré que le défaut de correspondance entre les renseignements sur la profession inscrits dans les bulletins de recensement et les données correspondantes figurant dans le registre des décès est dû à l'inexactitude des déclarations. En pareil cas, la méthode des enquêtes rétrospectives — qui a été décrite à propos des causes de décès (voir p. 57) — pourra aussi donner des résultats utiles pour l'évaluation de l'exactitude des caractéristiques économiques mentionnées sur les registres des décès. Selon cette méthode, on choisit un échantillon de certificats de décès et on cherche à obtenir, auprès des ménages correspondants, des renseignements plus précis et plus détaillés sur l'activité économique du décédé. L'étude approfondie de ces renseignements permettrait de déterminer, au moyen de normes homogènes, le degré d'exactitude des déclarations faites au moment du décès, en ce qui concerne la profession et la branche d'activité. Pour se renseigner auprès des ménages, il faut disposer d'une équipe d'enquêteurs ayant une parfaite connaissance de la question; on sera donc forcé de recourir à la méthode de sondage. Toutefois, on pourrait envisager de procéder, dans certaines régions, à une enquête par correspondance.

[9] *The Comparability of Reports on Occupation from Vital Records and the 1950 Census, op. cit.*, p. 1 et suivantes; et *Census 1951, England and Wales; General Report, op. cit.*, p. 50 à 56.

CAUSES DE DÉCÈS

La cause du décès est le seul élément de la déclaration de décès pour lequel il existe un modèle de certificat établi par accord international. Le modèle international de certificat médical de la cause de décès[10] indique les éléments d'information d'ordre médical qu'il faut rassembler sur chaque cause de décès et l'ordre dans lequel les renseignements doivent être inscrits. Les règles régissant l'emploi de ce formulaire sont, elles aussi, tout à fait normalisées[11].

Cette normalisation de la déclaration des causes de décès s'inspire de l'idée selon laquelle c'est au médecin qui a traité le défunt qu'il appartient, normalement, d'établir le certificat médical indiquant la cause du décès, car il est mieux placé que toute autre personne pour donner un avis éclairé sur les états morbides qui ont abouti au décès et sur leurs rapports réciproques. Si le défunt n'a pas été traité par un médecin au cours de sa dernière maladie, c'est soit à une personne n'appartenant pas à la profession médicale, soit au fonctionnaire de la santé publique qui fait un rapport sur la cause du décès, soit, le cas échéant, au médecin qui procède à l'autopsie, soit enfin, si l'identité du défunt n'est pas connue ou si le décès paraît avoir été le résultat d'un acte de violence, à une autorité médico-légale — le médecin légiste — que revient la responsabilité d'en certifier la cause. L'autorisation d'inhumer ou, le cas échéant d'incinérer, n'est donnée que lorsque la cause du décès a été certifiée de telle manière qu'il n'est pas douteux que le décès est dû à des causes naturelles, et non à un acte de violence.

Dans nombre de pays du monde où les médecins en général et les médecins légistes en particulier sont peu nombreux, les causes de décès sont, dans la grande majorité des cas, déclarées par des personnes qui n'appartiennent pas à la profession médicale[12]. Pareilles déclarations n'ont évidemment pas la valeur d'un diagnostic médical, mais il n'y a aucun moyen d'en vérifier l'exactitude relative. C'est pourquoi certains pays n'établissent leurs statistiques de la mortalité selon la cause que d'après les décès certifiés par un médecin et que d'autres classent la plupart des décès dont la cause n'a pas été certifiée médicalement — sinon tous — dans la catégorie des "Causes mal définies ou inconnues" de la Classification statistique internationale des maladies, traumatismes et causes de décès. Il n'en reste pas moins que les causes déclarées par une autorité médicale peuvent, elles aussi, faire l'objet d'une appréciation qualitative et les méthodes par lesquelles on peut procéder à cette évaluation peuvent se ranger en deux catégories: la méthode directe et la méthode indirecte.

Examen des statistiques: Peut-être le premier moyen d'évaluer par l'analyse l'exactitude des statistiques des causes de décès consiste-t-il à examiner la proportion des décès pour chaque cause. Si une grande majorité des décès figurent dans la catégorie des causes mal définies ou inconnues (B45 de la liste abrégée), on peut dire, sans hésiter, que les fréquences pour les causes connues présentent des lacunes plus ou moins graves. Pour simplifier la

[10] *Classification internationale des maladies. Manuel de la classification statistique internationale des maladies, traumatismes et causes de décès.* Revision de 1955, vol. I (Publication de l'Organisation mondiale de la santé), p. 367.

[11] *Ibid* p. 365 à 381.

[12] Voir tableau 17, p. 398.

procédure, le Bureau de statistique de l'ONU applique, pour décider si un tableau de la mortalité selon la cause doit figurer ou non dans l'*Annuaire démographique,* la règle des 25 pour 100. Si, dans la répartition des décès selon la cause, 25 pour 100 des décès ou plus sont classés dans la catégorie B45 *(sénilité, sans mention de psychose, et causes mal définies ou inconnues),* les données ne sont pas publiées, sauf dans le volume spécial sur la mortalité qui paraît tous les cinq ans.

La proportion des décès classés, dans les divers groupes de maladies, sous la rubrique "sans précisions", bien qu'elle corresponde déjà à une exploitation plus détaillée des causes par catégories, est étroitement liée à cet indice de qualité. On peut citer comme exemples de ces rubriques la *Bronchite sans précisions* (501) et les *Autres dégénérescences du myocarde* (422.2). On a tendance à grouper, sous ces rubriques résiduelles tous les décès dus à des causes mal définies; ainsi, en règle générale, plus il y a de décès classés dans ces catégories de causes indéterminées, moins les statistiques pour les autres causes sont exactes.

Le total annuel des décès enregistrés pour une cause ou un groupe de causes comparé à la fréquence ou à la mortalité proportionnelle de la période antérieure pour la même cause peut aussi, dans une certaine mesure, servir à indiquer les insuffisances qualitatives. En effet, à moins que certaines catastrophes n'interviennent, les causes de décès sont chronologiquement constantes. Ainsi, si les chiffres enregistrés pour chaque cause ne correspondent pas à ceux des périodes précédentes et si l'on constate des fluctuations considérables qui ne s'expliquent ni par un changement d'hygiène ou de conditions sanitaires ni par des modifications du système de classement, il y a tout lieu de croire que les déclarations ou le dépouillement des données ont laissé à désirer. Les changements effectifs d'hygiène ou de conditions sanitaires seront peut-être assez facile à identifier, de même que les modifications apportées au classement qui nuiraient à la comparabilité entre les revisions. Une fois ces points élucidés, les irrégularités qui persisteront se trouveront isolées et pourront être examinées de plus près.

Un autre moyen de détecter les inexactitudes peut être recherché dans la répartition des décès selon la cause, l'âge et le sexe. Si l'examen des tableaux à multiple entrée révèle que des décès de nourrissons et de jeunes enfants sont attribués au suicide ou à l'homicide; si des décès de femmes sont attribués à des catégories de maladies qui n'atteignent que les hommes, ou inversement; si des décès d'enfants sont attribués à des complications de la grossesse ou des décès d'adultes à des maladies infectieuses du nouveau-né — en un mot si l'examen révèle un nombre excessif de fréquences non plausibles — l'exactitude du codage de base est suspecte et la fiabilité des données peut être mise en question. Il convient toutefois de noter à cet égard que des causes de décès qui, à première vue, sembleraient limitées à certains groupes d'âges, par exemple les *Lésions obstétricales . . .* (B42), les *Malformations congénitales* (B41), les *Accouchements et complications de la grossesse . . .* (B46), sont en fait, dans certains pays, applicables à toute la durée de la vie, de sorte que les fréquences indiquées pour ces causes dans les catégories d'âge supérieures n'indiquent pas nécessairement que les statistiques sont de mauvaise qualité.

Le principal indicateur de fiabilité des statistiques des causes de décès — mais un indicateur dont on ne dispose pas toujours facilement — est sans doute la proportion des décès constatés par un médecin. Cet indicateur ressort de la tabulation des décès selon la cause et le type de certificat médical. La proportion des décès pour lesquels on peut établir que le défunt a bénéficié de soins médicaux pendant sa dernière maladie devrait constituer l'élément principal de l'indice. Un deuxième groupe de décès que l'on considère parfois comme ayant été constatés par un médecin sont ceux qui font l'objet d'un certificat médical de décès, signé d'un médecin ou d'un "médecin légiste" qui a examiné le corps après le décès; il s'agit surtout de cas de mort soudaine — naturelle ou violente — relevant de la médecine légale; cependant dans certains pays, la loi exige l'examen du corps dans tous les cas, même si le défunt a été traité par un médecin. Un troisième groupe est constitué par les décès dont le certificat a été établi sur l'avis d'un médecin qui a fait un rapport sur la cause du décès, mais sans examen du corps. Les cas où ce rapport est fait par un personnel paramédical peuvent faire l'objet d'une quatrième catégorie. Le pourcentage des décès pour lesquels il y a vraiment "certification médicale", c'est-à-dire de ceux pour lesquels le certificat a été établi par le médecin traitant, n'est pas facile à déterminer. Toutefois, la combinaison des divers éléments cités plus haut donne des indices qui varient de 100 pour 100 pour la Suisse à 87 pour 100 pour le Venezuela et à 30 pour 100 pour le Pérou.

Au Venezuela, la proportion de 87 pour 100 est celle des décès dont le certificat a été *signé* par un médecin, mais, dans 30 pour 100 des cas, sans que le défunt ait bénéficié des secours de la médecine. Aux Etats-Unis, de 25 à 30 pour 100 de tous les décès sont certifiés après un examen du corps. L'interprétation de la signification de l'indice doit être laissée aux soins des autorités nationales, mais, dans l'ensemble, quelle que soit la définition donnée, une proportion élevée de toutes les causes certifiées par un médecin, est l'indice de statistiques relativement fiables.

Comparaison avec d'autres données: Comme dans le cas d'autres caractéristiques de la mortalité, pour connaître directement la valeur des indications que les certificats de décès donnent sur les causes de décès, on compare les données fournies par les certificats avec celles d'une autre source.

Ainsi, on pourrait mesurer l'exactitude des déclarations attribuant les décès à des maladies infectieuses en confrontant les certificats de décès et les déclarations de cas de maladies infectieuses. Ce genre de vérification partielle est possible aussi pour les décès dus à des néoplasmes, qui doivent également être déclarés dans certains pays. De même, les registres distincts existant pour le cancer peuvent servir de source d'information indépendante. Les décès dus au suicide ou à l'homicide pourraient être contrôlés d'après les dossiers de la police; mais dans nombre de pays ce contrôle serait superflu, ces décès étant généralement déclarés par les services de police eux-mêmes.

Le pourcentage des certificats de décès comportant des mentions douteuses ou imprécises quant à la cause du décès peut donner une idée de l'exactitude fondamentale des déclarations. D'une manière générale, on estime qu'il convient de renvoyer ces documents au déclarant en lui demandant des éclaircissements, mais on peut utiliser

comme indice de fiabilité le rapport de l'ensemble des demandes auxquelles il n'a pas été répondu et des certificats insuffisamment rectifiés au nombre total des décès pour l'ensemble des causes.

Dans certains cas l'insuffisance des données dont disposent les médecins est la raison de l'incertitude, de sorte qu'une vérification de leurs dossiers ne pourrait confirmer l'exactitude de la cause indiquée. En pareil cas, l'évaluation doit résulter de la comparaison avec des sources indépendantes; ces sources peuvent être les dossiers cliniques des hôpitaux, les conclusions des rapports d'opération, de biopsie, d'examen de laboratoire ou d'autopsie. Toutefois, ce genre de vérification produira presque invariablement deux séries de données très différentes l'une de l'autre, non seulement parce que l'une est fondée sur des renseignements plus complets que l'autre, mais encore parce que, même si deux médecins s'accordent sur la cause d'un décès, ils peuvent désigner cette cause sur le certificat en usant de termes différents ou d'une manière telle qu'elle peut être classée sous deux rubriques différentes de la classification.

Si les divergences entre les diagnostics cliniques et les conclusions d'une autopsie, ou entre les certificats médicaux de cause de décès et les conclusions d'une autopsie ou d'un autre examen sont incontestablement imputables, dans bien des cas, à des erreurs, elles résultent souvent aussi de ce que nombre de décès sont dus, non à une cause unique, mais à des causes multiples et que ces causes secondaires ne figurent pas nécessairement sur toutes les déclarations de décès. D'autres facteurs ont également leur importance, par exemple l'évolution des concepts médicaux et nosologiques et des normes de diagnostic qui influencent le médecin, qu'il s'en rende compte ou non, lorsqu'il indique la cause sur le certificat. De ce fait, des divergences apparaîtront entre les causes établies à partir des données identiques.

Le caractère confidentiel des déclarations des médecins est un autre facteur qui peut être à l'origine de divergences entre ces déclarations et les dossiers cliniques ou les résultats des autopsies. Le caractère essentiellement confidentiel des renseignements que le médecin recueille auprès du malade est un trait commun à tous les pays, mais il est plus ou moins strict, et son application aux déclarations des causes de décès est variable. Dans un certain nombre de pays (surtout en Europe), les renseignements sur la cause du décès sont confidentiels et des mesures propres à garantir ce caractère confidentiel entourent la transmission du rapport médical au service statistique intéressé. Dans d'autres pays, où ces mesures n'existent pas, on peut supposer que la cause indiquée n'est pas toujours la cause véritable, surtout lorsqu'il s'agit de maladies auxquelles s'attache un blâme social, comme la syphilis, l'alcoolisme, les maladies mentales, etc. Ainsi, les efforts déployés pour vérifier l'exactitude des causes déclarées seront infructueux dans les pays où les déclarations des causes de décès sont anonymes et n'auront guère de succès non plus dans les autres régions, à cause de la répugnance que l'on aura à révéler des maladies socialement inacceptables.

Enquête rétrospective: Une autre procédure qui permet de vérifier l'exactitude des déclarations médicales et non médicales des causes de décès consiste à procéder à une enquête de contrôle rétrospective; l'enquêteur interroge les déclarants, afin d'établir, pour un échantillon de décès, les circonstances qui ont entouré la maladie mortelle. Une telle étude, entreprise sous les auspices de la *Pan American Health Organization,* est actuellement en cours[13]. Elle porte sur 10 grandes villes du continent américain (le nombre des décès médicalement certifiés étant plus élevé dans les villes que dans les campagnes) et vise à obtenir, pour chaque cas, l'historique complet de la maladie qui s'est terminée par le décès et à faire établir systématiquement par un expert la cause principale du décès. On espère par ce moyen arriver à établir des statistiques comparables de la mortalité pour certaines villes, mais la même technique pourrait être utilisée pour évaluer l'exactitude des déclarations initiales des causes de décès.

Les causes de décès certifiées par des personnes n'appartenant pas à la profession médicale ou par du personnel paramédical pourraient faire l'objet d'enquêtes rétrospectives systématiques qui seraient confiées à des enquêteurs spécialisés chargés d'obtenir la description des symptômes. Dans la plupart des pays, le coût d'une telle procédure, si elle était appliquée à tous les décès, serait prohibitif, mais on pourrait choisir un échantillon de décès certifiés par des personnes n'appartenant pas à la profession médicale (c'est-à-dire, à proprement parler, non certifiés) qui feraient l'objet d'une enquête plus poussée. L'échantillon ne serait sans doute pas pris au hasard; il s'agirait plutôt d'un sondage par quotas offrant un intérêt particulier pour la santé publique et limité peut-être aux régions urbaines. De telles enquêtes permettraient d'évaluer l'exactitude des causes indiquées.

Evaluation du système de codage: Les inexactitudes des statistiques des causes de décès proviennent non seulement de l'imprécision de la cause indiquée, mais encore de la manière dont cette cause est rapportée à un numéro de code aux fins de la classification.

Selon les recommandations internationales[14], la cause à coder est la cause initiale, c'est-à-dire celle qui a provoqué l'enchaînement des états morbides qui ont finalement abouti au décès. S'il est déclaré plus d'une cause, le certificat international prévoit que l'autre cause sera indiquée en second lieu, après la cause directe ou immédiate. C'est cette deuxième cause qu'il s'agit de coder. Cependant, pour tenir compte des erreurs possibles dans l'indication de la cause sur le certificat, des règles et dispenses spéciales sont prévues afin d'aider le codeur à choisir, sur des certificats qui paraîtraient contradictoires, ambigus ou incomplets, la cause appropriée. La manière dont ces règles sont appliquées et le jugement porté sur les données des certificats font que la même cause est parfois classée de façon différente. Le problème s'aggrave lorsque le codage des causes de décès se fait sur une base géographiquement décentralisée.

L'importance des divergences entre les systèmes de codage peut être évaluée au moyen d'un test en vertu duquel différents groupes de codeurs chiffrent la même série de certificats de décès. L'un des premiers tests de ce genre qui ait été fait à l'échelle internationale remonte à 1934, où une série de 1 073 certificats de décès dus à des "causes liées à la grossesse" et survenus aux Etats-Unis en

[13] Pan American Health Organization. *Report of the Planning Conference for Regional Development of Epidemiological Studies,* 1-4 mai 1961. Miméo. 8 p.

[14] *Classification internationale des maladies, op. cit.,* p. 365.

1927 a été envoyée dans 24 pays accompagnée d'une note demandant que ces décès soient affectés, selon le cas, à des causes puerpérales ou non puerpérales[15]. Seize pays ont répondu à la demande et l'on a constaté d'importantes divergences dans le classement.

Une enquête du même genre, mais de plus vaste portée, a été entreprise à l'occasion de la revision de 1929 de la Nomenclature internationale des causes de décès: en juin 1935, à la demande de la Commission de revision, le *Bureau of Census* des Etats-Unis a adressé à plusieurs pays une liste de 1 032 cas de décès, comportant chacun de deux à cinq causes distinctes, en leur demandant de chiffrer la cause initiale du décès. Les réponses ont révélé de grandes différences dans les règles et principes de classement appliqués par les divers pays en 1935[16].

Tandy. Department of Labor. Children's Bureau. Publication No 229. Gov. Print. Off., Washington, 1935, 24 p.

[16] "Classification of Joint Causes of Death." *Vital Statistics—Special Reports.* Vol. 5, No 47.

Sans doute d'autres enquêtes du même type ont-elles été faites dans l'intervalle; mais celle qui a été menée en 1961 sous les auspices du Centre de l'Organisation mondiale de la santé pour la Classification des maladies, à Londres (Angleterre), présente un intérêt particulier[17]. Il s'agissait de vérifier l'interprétation donnée aux règles de chiffrage à l'échelon local en demandant au *Canadian Dominion Bureau of Statistics,* au *General Register Office* du Royaume-Uni et au *United States National Office of Vital Statistics* de chiffrer trois échantillons pris au hasard de 2 000 certificats de décès chacun. Sur les 6 000 unités à coder, il y a eu 390 cas où le codage n'a pas été unanime. Dans 50 pour 100 de ces cas, les différences étaient le résultat d'incertitudes quant à la maladie que le certificateur considérait comme la cause initiale. La même technique peut être appliquée à l'échelle nationale pour déceler ce type d'erreur et en évaluer l'importance.

CHAPITRE II. *NOTES TECHNIQUES SUR LES TABLEAUX STATISTIQUES*

INTRODUCTION

ORIGINE DES DONNEES

Sauf indication contraire, les statistiques présentées dans l'*Annuaire démographique* sont des données officielles. Elles ont été rassemblées par le Bureau de statistique de l'Organisation des Nations Unies à partir des renseignements que communiquent mensuellement ou annuellement les services officiels de statistique ou autres organismes compétents de plus de 200 pays et territoires, ces renseignements étant complétés, le cas échéant, par des chiffres empruntés aux publications officielles.

Afin d'assurer la comparabilité du point de vue des méthodes de calcul, tous les taux et rapports autres que les valeurs des fonctions des tables de mortalité (à l'exception de quelques cas signalés dans les tableaux) ont été calculés au Bureau de statistique de l'Organisation des Nations Unies selon les méthodes exposées pour chaque tableau. Les chiffres de population utilisés pour le calcul des taux sont des données de recensement ou des estimations qui ont été, presque toutes, reproduites dans la présente édition de l'*Annuaire* ou dans une édition antérieure.

Chaque fois que l'on constatera des différences entre les données du présent volume et celles des éditions antérieures de l'*Annuaire démographique,* on pourra tenir pour acquis que les statistiques publiées cette année sont des chiffres revisés communiqués au Bureau de statistique avant le 31 décembre 1961.

CHAMP DES STATISTIQUES

Portée géographique

Conformément aux plans adoptés à l'origine, on a cherché à rendre la portée géographique des tableaux aussi large que possible dans certaines limites. Cela signifie que, d'une façon générale, chaque tableau de l' *Annuaire* présente des statistiques de portée nationale pour tous les pays et territoires qui ont communiqué les données voulues. En outre, lorsqu'il n'a pas été possible d'obtenir des statistiques pour l'ensemble du territoire ou de la population, on a publié des données de portée plus limitée, se rapportant à des zones d'enregistrement ou même à des villes particulières chaque fois que l'on a jugé que ces statistiques présentaient encore assez d'intérêt. Il est à noter que la publication de toutes les données disponibles n'implique aucun jugement de valeur sur leur exactitude. S'il a été possible d'étendre ainsi au maximum la portée géographique des tableaux, c'est parce que l'on disposait des codes de qualité exposés aux pages 64 et 65.

Le tableau 1 est plus complet; il donne l'effectif de la population et la superficie de chaque pays — souverain ou non — comptant au moins 50 habitants, ce qui a permis de présenter au tableau 2 des chiffres globaux concernant la situation de la population et son accroissement ainsi que les taux de natalité et de mortalité pour le monde et 14 régions géographiques. Après celles du tableau 1, les données les plus complètes sont les séries chronologiques et les statistiques de l'état civil. Les répartitions de fréquences selon les caractéristiques de la population couvrent un champ plus limité, tandis que la portée géographique des tableaux diminue à mesure que des variables sont introduites.

Il convient également de noter que les tableaux contenant des taux ont naturellement une portée géographique un peu plus restreinte que les tableaux où sont présentés des nombres absolus. Les critères appliqués pour le calcul des taux sont exposés dans la section "Description des tableaux" (p. 71 et suivantes).

Définition du territoire (région géographique)

Autant que possible, les séries chronologiques aussi bien que les distributions de fréquence se rapportent au territoire actuel (1961) des unités géographiques indiquées. Lorsque le territoire auquel les chiffres se rapportent diffère du territoire de 1961, on a signalé en note la nature de la différence.

Dans les cas où, par suite de modifications territoriales fréquentes ou récentes, ou pour d'autres raisons, la composition du territoire actuel appelle une précision, une brève définition est donnée en note dans le tableau 1. Il convient de noter que les renseignements relatifs à la composition des territoires se trouvent exclusivement dans le tableau 1, sauf s'ils ont trait à des modifications territoriales ou administratives intervenues en 1961. Pour éviter toute confusion en ce qui concerne l'année de transition, le territoire actuel des pays intéressés — il n'y en a qu'un petit nombre — est défini dans les notes des tableaux où ces pays sont mentionnés, même lorsque les données se rapportent au territoire actuel.

Définition de la population

Lorsqu'on a rassemblé les statistiques nationales en vue de leur publication, on s'est efforcé essentiellement d'obtenir des données sur la population présente ou population de fait, plutôt que sur la population de résidence habituelle ou population de droit. Aussi, sauf indica-

tion contraire, les statistiques de la population et celles de l'état civil concernent à la fois les nationaux et les étrangers, nés dans le territoire ou en dehors, les aborigènes, les tribus de la jungle, les nomades, les personnes déplacées, les détenus, les réfugiés, ainsi que toutes autres catégories d'individus se trouvant dans le pays ou territoire à une date donnée.

Il convient cependant de noter que, lorsqu'on disposait des statistiques nécessaires, on a ajusté ou rectifié les estimations de population de manière à englober les militaires nationaux et le personnel diplomatique étrangers ainsi que les prisonniers de guerre ennemis se trouvant sur le territoire. Pour plus de clarté, on a expliqué ces ajustements dans les tableaux contenant les chiffres de population et, au besoin, dans ceux où sont présentés des taux calculés à partir de ces chiffres. On trouvera un exposé plus complet des méthodes d'ajustement à la page 62.

NOMENCLATURE

Le tableau 1 — le plus complet en ce qui concerne la portée géographique et les définitions de territoire — suit de près la nomenclature officielle actuelle, les noms de pays qui y sont donnés correspondant aux désignations complètes officiellement employées à l'Organisation des Nations Unies à la date du 31 décembre 1961[1].

Cependant, comme la place manque dans les autres tableaux, on a jugé commode, pour certains pays et territoires, d'utiliser une désignation abrégée. Les pays dont le nom figure sous une forme abrégée, dans les tableaux 3 à 29, sont les suivants : le Royaume-Uni de Grande-Bretagne et d'Irlande du Nord, désigné par Royaume-Uni; les Etats-Unis d'Amérique, désignés par Etats-Unis; l'Union des Républiques socialistes soviétiques, la République socialiste soviétique de Biélorussie et la République socialiste soviétique d'Ukraine, respectivement désignées par URSS, RSS de Biélorussie et RSS d'Ukraine.

Ordonnance des noms

L'ordonnance des noms dans les colonnes réservées aux noms de pays et dans les têtes de colonnes des tableaux se présente sous deux formes :

Dans le tableau 1, toutes les principales unités géographiques du monde, pour chaque continent et pour l'URSS (classés dans l'ordre alphabétique anglais), sont rangées selon leur statut administratif. Pour chaque continent, on a d'abord donné, sans autre précision, les pays indépendants; puis viennent les territoires et dépendances, les territoires sous tutelle, les régions sous administration militaire et les condominiums, ces unités étant classées selon l'autorité administrante. A l'intérieur de chaque catégorie, les noms sont rangés dans l'ordre alphabétique anglais.

Dans les tableaux 3 à 29 ne figurent que les pays et territoires pour lesquels on possède des statistiques : ils sont énumérés par continent dans l'ordre alphabétique anglais.

Le nom de l'autorité administrante n'est pas indiqué, sauf lorsque deux territoires ont le même nom et risqueraient par conséquent d'être confondus.

[1] Pour la plupart des pays et territoires, voir : Nations Unies, Groupe de terminologie. *Names of Countries and Adjectives of Nationality*. Document ST/CS/SER.F/177/Rev.1, 19 septembre 1961, 36 p. ronéo.

Etant donné leur nombre et leur importance, les changements de nom et modifications administratives et constitutionnelles survenus en 1961 sont signalés dans tous les tableaux. Pour des raisons de commodité, on rappellera ici ces changements dans l'ordre chronologique. Les changements intervenus en 1959, ou avant cette date, ont été indiqués dans les éditions antérieures de l'*Annuaire démographique*.

1961	*Ancien nom*	*Nom actuel*	*Nature du changement*
27 avril	Sierra Leone	Sierra Leone	Indépendance
31 mai	Union sud-africaine	Afrique du Sud	Nom
1er juin	Cameroun septentrional (administration britannique)	Rattaché à la Région du Nord de la Nigéria	Indépendance
29 septembre	République arabe unie — Région syrienne	Syrie	Indépendance
29 septembre	République arabe unie — Région égyptienne	République arabe unie	Nom
1er octobre	Cameroun méridional (administration britannique)	Rattaché à la République du Cameroun	Indépendance
27 octobre	République populaire mongole	Mongolie	Nom
9 décembre	Tanganyika	Tanganyika	Indépendance

Les désignations utilisées dans cette publication et la présentation des données qui y figurent n'impliquent de la part du Secrétariat de l'ONU aucune prise de position quant au statut juridique de tel ou tel pays ou territoire, ou de ses autorités, ni quant au tracé de ses frontières. Ces désignations n'ont d'autre objet que de donner un cadre géographique commode aux séries statistiques. La même observation vaut pour toutes les notes et précisions fournies sur les unités géographiques pour lesquelles des données sont présentées.

EVALUATION DE LA QUALITE DES DONNEES

Comme on a commencé à le faire dans l'édition de 1959 de l'*Annuaire démographique*, on a essayé dans la présente édition de différencier les données selon leur degré d'exactitude en utilisant pour l'impression deux caractères distincts : le romain pour les données reconnues exactes et l'italique pour les données dont l'exactitude est discutable.

Le classement dichotomique, par qualité, des chiffres de population présentés dans les tableaux 1-5 est fondé sur le code initialement établi pour les estimations en 1950, lequel a été progressivement modifié depuis lors. Les bases théoriques de ce code, ainsi que les raisons qui justifient son emploi pour l'évaluation des données sont exposées en détail à la page 64.

Les statistiques de l'état civil ont été classées en statistiques exactes et statistiques discutables selon le degré de complétude attribué à l'enregistrement des faits d'état civil courants. Comme dans les *Annuaires* précédents, les statistiques de l'état civil sont jugées complètes lorsqu'elles représentent au moins 90 pour 100 du nombre total des naissances, des décès, des mariages et des divorces qui ont eu lieu pendant l'année considérée. Les séries considérées comme complètes ou exactes sont reproduites en caractère romain; celles qui sont moins exactes ou dont le degré d'exactitude n'est pas connu, en italique. Le code de qualité ordinaire (C et U) sur lequel repose le classement figure, comme d'habitude, dans les tableaux

chronologiques; on trouvera à la page 65 des précisions sur la manière dont il a été établi.

Pour compléter le classement approximatif exposé ci-dessus, les divergences connues entre les définitions, les méthodes d'estimation et les modes d'exploitation des données sont, comme à l'ordinaire, signalés en notes, au bas des tableaux. Les conséquences de ces divergences, ainsi que les plus communes des causes d'erreur et les risques de mauvaise interprétation des données sont exposés dans les paragraphes consacrés à chaque tableau (p. 71 et suivantes).

Dans l'*Annuaire démographique* de 1952, on avait pour la première fois analysé les erreurs de déclaration d'âge dans les recensements et, de ce point de vue, classé les recensements selon leur degré d'exactitude. Cette évaluation, qui ne porte que sur les résultats des recensements effectués en 1950 ou autour de cette date, a été faite dans chaque édition successive de l'*Annuaire* jusqu'en 1955 et a été reprise dans l'édition de 1960; on a donné de brèves indications à ce sujet à la page 63 de la présente édition.

Un autre signe, réintroduit dans l'édition de 1953, a été conservé. Il s'agit de la croix (†) servant à distinguer les statistiques exploitées selon l'année de l'enregistrement de celles qui sont exploitées selon l'année de l'événement. On ne saurait trop insister sur l'importance de cette distinction, particulièrement en ce qui concerne l'évaluation de la qualité des statistiques des naissances vivantes; on trouvera à la page 66 un exposé détaillé de ses conséquences.

SUPERFICIE

Dans les tableaux 1 et 2 du présent volume, on trouvera des renseignements sur l'étendue ou la superficie des territoires considérés. Le tableau 1 donne le chiffre estimatif le plus récent de la superficie de chaque unité géographique du monde; le tableau 2 donne la superficie totale de chaque continent, de chaque région et de l'ensemble du monde. Sauf indication contraire, tous ces chiffres représentent des superficies totales, c'est-à-dire qu'ils englobent les terres émergées et les eaux intérieures, à l'exception des régions polaires et de certaines îles inhabitées. Les eaux intérieures sont censées comprendre les principaux lacs et cours d'eau.

SOURCES DE VARIATIONS

Les défauts de comparabilité entre données relatives à la superficie sont dus essentiellement à des différences de définition; par exemple, on ne saurait comparer le chiffre de la superficie totale (terres et eaux) à celui de la superficie terrestre, à moins que la superficie des eaux intérieures soit négligeable. La définition du terme "eaux" peut également varier d'un pays à l'autre; dans un pays, ce terme peut s'entendre des principaux lacs et cours d'eau seulement (qui conformément à la norme constituent les eaux intérieures) et, dans un autre, il peut s'appliquer en outre à la zone maritime comprise à l'intérieur des golfes, aux baies et aux criques, ce qui risque d'entraîner un défaut de comparabilité entre les données de pays ayant des frontières maritimes étendues ou comprenant des îles habitées.

Les données de base relatives à la superficie posent aussi des problèmes. Certaines proviennent de levés géodésiques effectués dans des conditions scientifiques modernes; d'autres ne représentent que des conjectures reposant sur des renseignements fragmentaires ou aléatoires. Pour certains pays, les chiffres sont très récents et tiennent compte des derniers levés ainsi que de toutes les modifications territoriales importantes qui sont intervenues; pour d'autres, ils le sont moins et les rectifications de frontières les plus récentes risquent d'avoir été négligées. Comme on ignore pour beaucoup de pays la méthode de calcul de la superficie, la composition exacte du territoire et l'époque précise à laquelle se rapportent les données, il n'est pas possible de procéder, d'après le tableau 1, à des comparaisons rigoureuses d'un pays à l'autre.

Le fait que certains chiffres sont différents de ceux que l'on a publiés précédemment s'explique par la revision des estimations antérieures, par des augmentations effectives de la superficie terrestre — dues par exemple à des travaux d'assèchement — ou par l'utilisation de nouvelles unités de mesure. Dans la plupart des cas, il a été possible de déterminer la raison de ces revisions; toutefois, lorsqu'on n'a pas pu le faire, on a simplement remplacé les anciens chiffres par les nouveaux en admettant que ce sont ces derniers qui sont exacts.

Dans le présent *Annuaire,* les superficies sont exprimées en kilomètres carrés; le cas échéant, on a converti les chiffres communiqués en *miles* carrés sur la base de 2,589998 km^2 pour 1 *mile* carré. L'utilisation d'un autre coefficient conduirait évidemment à des résultats un peu différents. En outre, les chiffres ont été arrondis à l'unité la plus proche.

POPULATION

La présente édition de l'*Annuaire démographique* — la treizième — étant consacrée surtout aux statistiques de la mortalité, les statistiques de la population n'occupent que quatre tableaux, à savoir les tableaux 1, 2, 4 et 5. Le tableau 1 indique la répartition géographique des trois milliards d'habitants qui peuplent le monde, le tableau 2 présente des chiffres globaux pour le monde et les grandes régions géographiques, le tableau 4 retrace l'évolution de la population dans un grand nombre de pays et territoires, et le tableau 5 est consacré à la répartition courante de la population selon l'âge et le sexe. Ces tableaux peuvent être considérés comme constituant l'essentiel des statistiques de la population. On y trouve le genre de données dont on a le plus souvent besoin aux fins de l'analyse démographique ainsi que des renseignements sur les catégories de variations qui sont communes à toutes les statistiques de la population. Parmi les causes connues de variations, on peut citer les changements survenus dans la composition de la population "totale", l'importance variable du

sous-dénombrement et des omissions au moment du recensement et le défaut de fiabilité de la répartition non ajustée de la population selon l'âge. Toutes ces questions seront examinées dans les sections qui suivent.

SOURCES DE VARIATIONS

Définition de la population totale

Pour déterminer dans quelle mesure les données sont comparables, il convient de tenir le plus grand compte des différences de composition de la "population totale dénombrée" d'un pays à l'autre.

Population de fait et population de droit

Par population totale d'un pays, on entend d'ordinaire soit la population présente ou de fait, soit la population de droit. A proprement parler, la population présente ou de fait comprend toutes les personnes — résidents et non-résidents — dénombrées dans le pays à l'endroit où elles se trouvaient effectivement au moment du recensement. Au contraire, le dénombrement de la population de droit porte sur toutes les personnes qui ont leur résidence habituelle dans le pays, quel que soit l'endroit où elles se trouvent au moment du dénombrement. Aussi simples que ces critères puissent paraître, il est rare de les voir appliquer strictement. De plus, même lorsque les termes en question sont utilisés avec rigueur pour décrire la méthode par laquelle ont été obtenus des totaux partiels dans un recensement national de population, on s'expose souvent à des erreurs quand on les applique à des totaux nationaux aux fins de comparaisons internationales. En outre, le terme utilisé peut définir correctement la méthode de dénombrement (au lieu de résidence ou au lieu de présence), mais être tout à fait inapplicable aux séries statistiques.

Population de fait rectifiée (total international normalisé)

Afin d'augmenter la comparabilité internationale des résultats des recensements de population qui seraient effectués vers 1950 et d'obtenir de meilleures données pour le calcul d'agrégats mondiaux ou régionaux, la Commission de la population a recommandé de prendre pour base d'exploitation statistique la "population de fait rectifiée[2]". Cette notion a été reprise dans les *Principes et recommandations concernant les recensements nationaux de population*[3], qui doivent servir de guide pour la série de recensements de 1960. Dans ces recommandations, le nouveau total est appelé *total international normalisé;* c'est, par définition, "le nombre total des personnes présentes sur le territoire au moment du recensement, *à l'exclusion* des militaires et membres du personnel diplomatique étrangers dans le pays et de leurs familles s'y trouvant avec eux, mais *y compris* les militaires nationaux et membres du personnel diplomatique du pays et leurs familles à l'étranger, ainsi que les marins de commerce résidant dans le pays mais se trouvant en mer au moment du recensement".

Conformément à ces recommandations, les chiffres de population présentés dans l'*Annuaire* de 1961 — qu'il s'agisse de résultats de recensements ou d'estimations — correspondent, autant que possible, à la population présente rectifiée, soit, selon la nouvelle terminologie, au total international normalisé; en d'autres termes, ils *tiennent compte,* le cas échéant, des tribus de la jungle, des aborigènes, des nomades, des personnes déplacées et des réfugiés, ainsi que des militaires nationaux et membres du personnel diplomatique du pays et leurs familles à l'étranger, *mais non* des militaires et membres du personnel diplomatique étrangers et leurs familles se trouvant dans le pays, ni des prisonniers de guerre ennemis sur le territoire[4].

Exactitude des recensements

Population totale

Qu'il s'agisse de la population de fait ou de la population de droit, il est, à bien des égards, difficile d'éviter les omissions et doubles comptes dans le recensement de la population d'une unité géographique donnée. Les difficultés que l'on rencontre sont naturellement plus importantes dans les pays où la population n'est pas habituée aux recensements, mais, à vrai dire, elles se présentent dans tous les dénombrements[5].

En déterminant l'erreur par défaut au moyen d'une enquête de contrôle postcensitaire sur le terrain ou par d'autres procédés, il est possible de rectifier le chiffre de la population totale, mais on ne peut généralement pas rectifier les répartitions, si ce n'est peut-être la répartition géographique. La principale utilité de ces opérations de contrôle est donc de souligner les lacunes des recensements même les mieux organisés et exécutés, et d'encourager la précision. Afin de prévenir toute erreur d'interprétation des données présentées dans les différents tableaux de l'*Annuaire,* on a pris soin d'apporter des précisions sur les données provenant de recensements (autant que faire se peut) en indiquant, par exemple, population effectivement dénombrée ou données ajustées, et de faire figurer le coefficient de correction[6].

Répartition par âge

L'âge, qui est la caractéristique la plus universellement utilisée dans les statistiques de la population et dans celles de l'état civil, est généralement déterminé au moyen de deux types de questions, posées ensemble ou séparément. Dans un cas, on demande la date de naissance et dans l'autre l'âge exprimé en unités de temps révolu — en années — au dernier anniversaire pour des adultes, et en mois, semaines ou jours pour les enfants de moins de 1 an. Ces deux méthodes ne donnent pas nécessairement des résultats d'une égale exactitude. Il

I, *Aspects généraux d'un recensement de la population,* p. 100-101; vol. III, *Caractéristiques démographiques et sociales de la population,* p. 59-64.

[5] Pour plus de détails, voir *Annuaire démographique* de 1956, chapitre I, p. 70-72. Voir également *Manuel des méthodes de recensement de la population,* vol. I, *op. cit.,* p. 114-122.

[6] Pour les estimations du sous-dénombrement dans les différents pays, voir le tableau 1, p. 101.

est évident que la question relative à la date de naissance permet d'obtenir des données beaucoup plus précises que la question directe sur l'âge, mais il va sans dire qu'il serait vain de la poser dans les pays où bien des gens sont illettrés ou, pour toute autre raison, incapables d'indiquer leur date de naissance avec exactitude. Il arrive aussi que les réponses à la question directe soient inexactes, que l'erreur ait été faite par ignorance ou de propos délibéré.

Une autre source d'inexactitude réside dans la méthode de classement des données recueillies en ce qui concerne l'âge. La méthode recommandée consiste à passer de la date de naissance à l'âge au dernier anniversaire, en faisant la différence entre la date exacte de la naissance et la date de recensement. Les âges exprimés dans la plus grande unité possible de temps révolu — c'est-à-dire années, mois, semaines, jours — sont ensuite répartis en des groupes d'âge déterminés, ou, le cas échéant, classés par année d'âge. Toutefois, on n'a pas toujours recours à la méthode des années révolues. Dans certains pays, la population est classée par âge (mois ou jours) sur la base de l'année de la naissance, ce qui revient à définir l'âge par la différence entre l'*année* du recensement et *celle* de la naissance. En pareil, cas tous les enfants nés pendant l'année qui précède immédiatement celle du recensement sont censés être âgés de 1 an, même si, étant nés le 30 novembre et le recensement ayant été effectué le 1er janvier de l'année suivante, ils n'ont en réalité que 1 mois révolu. Lorsque ce mode de classement est utilisé, il est généralement facile de s'en rendre compte : le nombre des enfants de moins de 1 an est plus faible qu'il ne devrait l'être normalement eu égard à l'effectif des groupes suivants. Il est à noter cependant que, dans le cas d'une année de forte natalité, les effets de cette méthode ne sont pas toujours aussi apparents.

Une autre cause de non-comparabilité, qui n'existe d'ailleurs pas partout, est l'emploi de méthodes différentes — selon les civilisations — pour le calcul de l'âge, par exemple la méthode occidentale et la méthode orientale, ou, comme on les désigne plus communément, la méthode anglaise d'une part et la méthode chinoise d'autre part, selon laquelle on considère que l'enfant est âgé de 1 an à sa naissance et qu'il avance en âge d'un an à chaque nouvelle année chinoise. Les répercussions de cette méthode sont très apparentes pour le premier âge : les données concernant les enfants de "moins de 1 an" sont nettement inférieures à la réalité. Les effets sur les chiffres relatifs aux groupes d'âge suivants sont moins visibles. Les séries ainsi établies sont généralement ajustées avant d'être publiées, mais il ne faut pas exclure la possibilité d'erreurs de ce genre lorsque l'on compare des données censitaires sur l'âge.

Les causes d'erreur, dans l'enregistrement de l'âge, sont nombreuses; on peut citer notamment l'ignorance de l'âge exact, la négligence, la tendance générale à déclarer des âges se terminant par certains chiffres tels que 0, 2, 5 et 8 et, pour les personnes âgées, à exagérer leur âge, l'aversion irraisonnée pour certains nombres tels que 13 et les fausses déclarations faites délibérément pour des motifs d'ordre économique, social, politique ou simplement personnel. Les causes d'erreur mentionnées ci-dessus sont communes à la plupart des enquêtes sur l'âge et à la plupart des pays et nuisent considérablement à la comparabilité.

A cause de ces difficultés et de ces différences dans le dénombrement et le classement, les répartitions par âge et par sexe de la population d'un grand nombre de pays comportent certaines inexactitudes, notamment : 1) erreur par défaut dans les groupes d'âge correspondant aux enfants de moins de 1 an et autres jeunes enfants; 2) polarisation des déclarations sur les âges se terminant par le chiffre 0 ou 5; 3) prépondérance des âges pairs au détriment des âges impairs; 4) écart considérable et inattendu entre le nombre des hommes et celui des femmes pour certains âges, et 5) différence importante et difficilement explicable entre les effectifs de groupes d'âge successifs ou voisins. En comparant les statistiques fournies par des recensements successifs pour des cohortes d'âge et de sexe identiques et en étudiant la répartition par âge et par sexe de la population à chaque recensement, on peut constater l'existence de ces inexactitudes et de quelques autres; un certain nombre d'entre elles se retrouvent dans les recensements, même les plus modernes. Pour évaluer, sur la base de la polarisation sur certains chiffres (c'est-à-dire de la polarisation des déclarations sur les âges se terminant par le chiffre 0 ou 5), l'indice de Whipple ou indice de concentration[7] a été appliqué à un certain nombre de répartitions de la population par âge établies à partir des données fournies par les recensements effectués entre 1945 et 1954.

L'édition de 1960 de l'*Annuaire démographique* ainsi que celles de 1955 et de 1956 donnent une évaluation de l'exactitude des déclarations d'âge pour 91 séries. Si l'on peut admettre qu'il existe généralement certains liens entre cette préférence et d'autres sources d'inexactitudes dans les déclarations d'âge, on peut néanmoins dire que l'indice donne une assez bonne idée de l'exactitude de la répartition par âge établie à partir de données censitaires, *ainsi que des estimations intercensitaires qui en sont tirées.*

Valeur des estimations de population

La valeur des estimations de population dépend de la nature et de la qualité des statistiques employées pour les établir ainsi que de la méthode utilisée pour combiner ces statistiques. Le degré d'exactitude d'une estimation est suffisant si la probabilité qu'elle contienne une erreur relativement importante est faible ou si, dans une gamme de probabilités donnée, les erreurs sont relativement petites. Ainsi défini, le degré d'exactitude peut se mesurer si les erreurs possibles dans chacun des éléments de l'estimation ont été quantitativement évaluées. En ce qui concerne les statistiques de population, une évaluation quantitative de ce genre n'est faite systématiquement que dans quelques pays. On ne peut donc, dans la plupart des cas, déterminer le degré d'exactitude des estimations de population que d'une manière approximative, compte tenu des méthodes utilisées pour les établir.

Evaluation des estimations courantes de la population

Pour donner une idée approximative du degré d'exactitude probable des estimations courantes de la population totale, un code indiquant la manière dont elles sont établies avait été introduit, à titre d'essai, dans le tableau 1 de l'édition de 1949-1950 de l'*Annuaire démographique.* A la lumière des renseignements et connaissances supplé-

[7] "Thirteenth Census . . ." United States Bureau of the Census, vol. 1, p. 291-292.

mentaires, on s'est aperçu que les légères modifications apportées chaque année depuis 1952 étaient insuffisantes. En 1958, on a jugé possible et nécessaire de procéder à une revision plus radicale pour deux raisons : a) on était alors en mesure de distinguer plus nettement les facteurs logiques dont dépend l'exactitude de chaque estimation; b) il semblait y avoir intérêt à tenir davantage compte de l'écart entre la date où la population a été effectivement mesurée pour la dernière fois (par exemple la date du dernier recensement) et la date de l'estimation considérée. C'est pourquoi un nouveau code a été mis au point.

Pour établir le nouveau code, on a admis que cinq facteurs influent sur la qualité d'une estimation courante de la population, à savoir : 1) la nature du chiffre de population qui sert de base; 2) l'erreur probable que comporte ce chiffre de base; 3) le temps écoulé depuis qu'il a été établi; 4) la méthode d'ajustement chronologique ayant servi à mettre le chiffre de base à jour; 5) la qualité de la méthode d'ajustement chronologique. Cependant, comme on n'a recueilli jusqu'à présent que très peu d'indications comparables sur l'erreur probable que comportent les chiffres de base, on ne peut prendre systématiquement en considération que les facteurs 1, 3, 4 et 5. C'est pourquoi le code revisé se compose de quatre éléments, à savoir la nature des données de base, leur âge, la méthode d'ajustement chronologique et la qualité de cet ajustement. Voici d'abord quels sont les signes conventionnels du code. Pour des explications plus complètes, voir l'*Annuaire démographique 1960* p. 66-69.

Premier élément. Nature des données de base (lettres majuscules)

- **A** Recensement complet.
- **B** Recensement ou enquête par sondage.
- **C** Recensement ou enregistrement partiel.
- **D** Estimations conjecturales.
- **..** Nature des données de base inconnue.

Deuxième élément. Age des données de base (indices accompagnant les majuscules)

Dans chaque cas, l'indice est le nombre d'années écoulées depuis l'établissement des données de base.

Troisième élément. Méthode d'ajustement chronologique (lettres minuscules)

- **a** Ajustement d'après un registre de population permanent.
- **b** Ajustement d'après l'équation d'équilibre (solde des naissances, des décès et de la migration nette).
- **c** Ajustement d'après un taux d'accroissement présumé.
- **d** Pas d'ajustement; base constante pour au moins deux années consécutives.
- **x** Ajustement d'après des estimations de populations régionales.
- **..** Méthode d'ajustement inconnue.

Quatrième élément. Qualité de l'ajustement pour les types a et b (chiffre accompagnant la lettre a ou b)

1. Balance démographique sûre.
2. Balance démographique de qualité inconnue.
3. Balance démographique non sûre.

Qualité de l'ajustement pour le type c (chiffre accompagnant la lettre c)

1. Au moins deux recensements, à intervalle de dix ans ou moins.
2. Au moins deux recensements, l'intervalle entre les deux derniers étant de plus de dix ans.
3. Un ou aucun recensement.

Evaluation des séries chronologiques

Le code décrit ci-dessus a été conçu pour évaluer l'exactitude des estimations de la population totale à une date récente (milieu de l'année 1960 dans le cas présent). Cependant, comme il y a généralement une certaine continuité dans la manière dont les pays établissent leurs estimations de population d'une année à l'autre, le code peut aussi s'appliquer dans une certaine mesure aux estimations relatives à d'autres années récentes, notamment, selon toutes probabilités, à celles qui se rapportent à la période 1955-1961.

Dans les tableaux 4 et 5, on a établi une distinction entre les séries constituées d'estimations courantes établies au moyen d'une méthode considérée comme sûre et les séries discutables; ces dernières sont reproduites en italique. Pour des explications plus complètes sur la méthode d'évaluation, voir l'*Annuaire démographique 1960* p. 69.

[8] Note supprimée. [9] Note supprimée. [10] Note supprimée.

STATISTIQUES DE L'ETAT CIVIL

Aux fins de l'*Annuaire démographique,* on entend par statistiques de l'état civil les statistiques des naissances vivantes, des décès, des morts fœtales, des mariages et des divorces. Cela est conforme au Principe 201 du document de l'ONU intitulé *Principes directeurs d'un système de statistiques de l'état civil*[11], où les statistiques de l'état civil sont définies comme comprenant aussi les adoptions, les légitimations, les reconnaissances, les annulations et les séparations légales.

Les facteurs qui influent sur la comparabilité internationale des statistiques de l'état civil sont à peu près les mêmes que ceux qu'il convient de prendre en considération pour interpréter les variations observées dans les statistiques de la population. La portée des données du point de vue géographique et ethnique, la qualité des statistiques — c'est-à-dire leur degré de complétude —, les méthodes d'exploitation et la définition des faits d'état civil aux fins de la statistique sont autant d'éléments qui peuvent influer sur la comparabilité.

Les normes à observer pour améliorer les statistiques de l'état civil, notamment en ce qui concerne les facteurs susmentionnés, sont énoncées dans *Principes directeurs d'un système de statistiques de l'état civil*[12]. Grâce à la publication d'un *Manuel de statistique de l'état civil*[13], ces recommandations internationales pour l'amélioration et la normalisation des statistiques de l'état civil ont encore gagné en utilité et sont plus faciles à appliquer dans les divers pays. Ce *Manuel* traite également des sources d'erreur dans les statistiques de l'état civil; on trouvera ci-après un bref exposé sur cette question, mais il conviendra de se reporter au *Manuel* pour plus de détails.

SOURCES DE VARIATIONS

Portée géographique et ethnique restreinte

Bien que l'Organisation des Nations Unies ait recommandé d'établir par priorité des statistiques des naissances vivantes, des décès, des morts fœtales, des mariages et des divorces, ces statistiques sont loin d'être disponibles partout dans la même mesure[14]. Cela tient en partie au manque d'uniformité et d'universalité des législations nationales. Dans certains pays ou territoires, l'enregistrement n'est obligatoire que pour les naissances et les décès; dans d'autres, il ne l'est que pour une faible partie de la population (par exemple, population européenne, civilisée ou non indigène). Dans d'autres pays encore, tels que l'Inde et le Pakistan, il n'existe pas de disposition qui prescrive l'enregistrement obligatoire sur le plan national, mais seulement des règlements ou décrets des municipalités ou des Etats, qui ne s'appliquent pas à l'ensemble du pays. Il en est encore autrement dans d'autres pays (comme l'Indonésie), où les autorités ont institué des zones d'enregistrement comprenant seulement une partie du territoire, le reste étant exclu en raison des difficultés d'accès ou parce qu'il est pratiquement impossible, pour des raisons d'ordre économique ou culturel, d'y procéder à un enregistrement régulier.

En examinant les tableaux, on remarquera que l'enregistrement des faits d'état civil est particulièrement fragmentaire en Afrique, où il ne porte le plus souvent que sur la population européenne, tandis que la population indigène ne fait généralement l'objet que de quelques statistiques ou d'estimations partielles. De même, pour une grande partie de l'Asie et pour certaines régions de l'Amérique latine, les statistiques sont incomplètes, peu sûres et de portée inégale. Lorsque les statistiques disponibles sont fragmentaires, la comparabilité internationale s'en trouve sérieusement compromise.

Qualité des statistiques

La qualité des données varie non seulement parce que dans certains pays il n'existe pas de disposition qui prescrive l'enregistrement des faits d'état civil, mais aussi par suite de différences d'efficacité, d'un pays à l'autre, dans l'application des lois. Les modalités d'application de la loi et son degré d'observation par le public déterminent l'exactitude et la complétude des statistiques tirées des registres de l'état civil.

Evaluation des statistiques courantes

Les imperfections des statistiques de l'état civil apparaissent souvent de manière assez évidente. Un examen des taux calculés ou présumés révélera parfois les cas où il est sans doute justifié de soupçonner un défaut de complétude. Toutefois, cette observation est valable uniquement lorsque les statistiques présentent des lacunes évidentes et sont exploitées d'après la date de l'événement; l'exploitation des données d'après la date de l'enregistrement donne souvent des taux assez élevés pour paraître exacts, tout simplement parce qu'ils tiennent compte d'un grand nombre d'enregistrements tardifs. Il ne faut pas oublier, en outre, que les renseignements dont on dispose sur les taux "escomptés" de fécondité, de mortalité et de nuptialité sont extrêmement sommaires pour un grand nombre de régions du monde et que les cas limites, qui sont les plus difficiles à reconnaître, sont fréquents.

Toutefois, on risque d'arriver à des résultats très trompeurs si l'on évalue la qualité des données en se fondant uniquement sur les séries présentées dans les tableaux. Pour recueillir à ce sujet des renseignements de première main, l'Organisation des Nations Unies, en 1956, s'est tout spécialement efforcée d'obtenir de chaque pays des estimations de la complétude et de l'exactitude de ses statistiques de l'état civil, en utilisant les questionnaires annuels qui servent à l'élaboration de l'*Annuaire démographique*. La documentation recueillie en 1956 a été, depuis lors, systématiquement complétée et tenue à jour au moyen des nouveaux renseignements sur la qualité des statistiques.

D'après les renseignements directement fournis par les gouvernements, ou tirés soit du questionnaire, soit de publications officielles, il a été possible de classer les statistiques de l'état civil selon leur qualité en trois catégories :

C Celles qui sont signalées comme relativement complètes, c'est-à-dire qui représentent dans la proportion d'au moins 90 pour 100 les faits d'état civil survenus chaque année.

U Celles qui sont signalées comme discutables, c'est-à-dire qui englobent moins de 90 pour 100 des faits considérés.

... Celles sur lesquelles il n'a pas été possible d'obtenir des renseignements précis.

La formule adoptée pour classer les données selon leur degré d'exactitude ne permettait pas d'appliquer des critères uniformes et objectifs. Dans bien des cas, on ne savait pas quels éléments d'appréciation les services nationaux avaient utilisés. Néanmoins, on a estimé que les bureaux de statistique nationaux étaient les mieux placés pour évaluer la qualité de leurs propres données et que, malgré leur étendue, les deux catégories qu'il a été possible de distinguer selon cette méthode seraient utiles, puisqu'elles donneraient au moins une idée de la fiabilité des statistiques publiées dans l'*Annuaire*.

Les résultats de ce classement (notations **C**, **U** ou **...**) figurent dans la première colonne des tableaux 6, 8, 11, 12, 14, 27 et 29, qui indiquent, pour une longue période, la fréquence totale des naissances vivantes, des décès périnatals, des décès à tous âges, des décès d'enfants de moins de 1 an, des morts fœtales, des mariages et des divorces. On trouvera aussi au bas des tableaux des notes indiquant, lorsqu'ils sont connus, les éléments précis sur lesquels se fonde le classement codé.

Non seulement tous les tableaux retraçant une évolution de longue période comprennent une colonne où figurent les notations du code de qualité, mais les données dans la catégorie **U** et celles dont le degré d'exactitude n'est pas connu (**...**) sont reproduites en italique, afin que l'on puisse les distinguer aisément des données moins sujettes à caution.

Bien que le code apparaisse seulement dans les tableaux qui retracent l'évolution à long terme, il est naturellement applicable à toutes les statistiques de l'état civil récentes publiées dans l'*Annuaire* pour les pays en question. Aussi, lorsqu'on veut comparer ou analyser les

[14] On trouvera une analyse, par région, de la portée géographique et ethnique des statistiques de la natalité et de la mortalité dans l'*Annuaire démographique* de 1956, chap. I, tableau J, p. 76.

données des tableaux 6 à 29, il convient de se reporter d'abord au code. En ce qui concerne les valeurs des fonctions des tables de mortalité (tableaux 24, 25 et 26), on a généralement procédé à des ajustements pour tenir compte de l'insuffisance des données de base.

Par définition, le code ne peut servir, sous sa forme actuelle, que pour les données exploitées d'après la date de l'événement (voir plus loin). L'exploitation des faits d'état civil d'après la date de l'enregistrement écarte automatiquement toute possibilité de l'appliquer, puisque les symboles **C** et **U** sont censés indiquer le caractère complet ou incomplet de l'enregistrement, au cours de l'année considérée ou immédiatement après, des faits d'état civil survenus pendant l'année.

Evaluation des séries chronologiques concernant les statistiques de l'état civil

Il est plus difficile d'évaluer la qualité des séries chronologiques des statistiques de l'état civil. Les estimations de la qualité courante reposant en général largement sur des conjectures, on manque le plus souvent d'évaluations objectives pour les années antérieures. En l'absence de mesures de qualité pour les années précédentes, on a admis que la qualité de la série chronologique tout entière serait la même que celle des données courantes; c'est pourquoi les séries chronologiques sont reproduites en italique lorsque le code de l'année en cours est **U** (discutable) ou **...** (inconnu).

Cette méthode n'est certes pas entièrement satisfaisante (les données des premières années étant souvent beaucoup plus sujettes à caution que le code ne l'indique), mais, comme on a jugé souhaitable d'identifier plus clairement les données discutables et que l'emploi du code actuel à cette fin ne peut conduire qu'à surestimer plutôt qu'à sous-estimer la qualité des données, c'est d'après ce code, malgré ses insuffisances, que l'on a décidé d'établir le classement. De même, on a cru bon d'admettre que les données dont le degré de complétude est encore inconnu peuvent être considérées comme discutables et reproduites en italique, comme celles qui sont classées dans la catégorie **U**.

A proprement parler, le code de qualité s'applique aux nombres absolus de faits d'état civil enregistrés et, par conséquent, ne vaut qu'indirectement pour les taux qui dépendent également des chiffres de population servant de dénominateurs. Toutefois, il importe de souligner que les deux éléments constitutifs d'un taux ne sont pas indépendants, surtout lorsque ce sont les statistiques de l'état civil qui ont servi à établir les estimations de population. Par conséquent, les taux établis à partir de statistiques discutables sont classés dans la catégorie des données discutables, bien qu'ils puissent paraître vraisemblables, pour une raison ou pour une autre. Il est possible d'évaluer plus justement la qualité des taux courants en examinant aussi les notations relatives aux estimations de population qui sont présentées dans les tableaux 1 et 4.

Méthodes d'exploitation des données

Statistiques relatives au lieu de l'événement

Conformément à la partie c du *Principe* 409[15], les statistiques de l'état civil présentées dans l'*Annuaire* se rapportent à la population de fait ou population présente. Sauf indication contraire, ces statistiques comprennent donc les faits survenus dans l'ensemble de la population, à l'intérieur des frontières actuelles des pays et territoires considérés. Les notes servent uniquement à signaler des exceptions, sauf dans le cas des décès de militaires; pour plus de clarté, les conditions dans lesquelles il est tenu compte de ces décès sont précisées autant que possible, qu'elles constituent ou non une exception à la norme.

Il est reconnu dans les *Principes* 402 et 403[16] que, du point de vue national, il est nécessaire de distinguer entre les statistiques selon qu'elles se rapportent à des régions ou à des groupes de population pour lesquels l'enregistrement des faits d'état civil est raisonnablement complet ou nettement incomplet. Conformément à ces *Principes,* les statistiques de certains pays font régulièrement abstraction des groupes de population pour lesquels l'enregistrement, bien qu'obligatoire, n'est pas même raisonnablement complet et les statistiques, par conséquent, très sujettes à caution. Parmi ces pays, on peut citer le Panama et le Venezuela, où les statistiques de l'état civil ne tiennent pas compte des données relatives aux tribus indiennes; le Pérou, où la population de la jungle n'est pas comptée; la Guyane britannique, le Surinam, la Syrie et l'Australie, qui excluent de leurs statistiques les nomades aborigènes. Tous les cas de ce genre, où les statistiques ne portent que sur une partie du territoire national ou de la population du pays, sont indiqués en note dans les tableaux.

Exploitation des données selon la date de l'événement ou la date de l'enregistrement

Autant que possible, les statistiques de l'état civil figurant dans l'*Annuaire démographique* correspondent aux événements survenus pendant l'année indiquée et non aux faits enregistrés au cours de cette année. Cela est conforme à la recommandation que l'Organisation des Nations Unies a faite à ce sujet dans les *Principes*[17].

Symbole : On pourra toutefois constater dans les tableaux que, malgré cette recommandation internationale, un grand nombre de pays exploitent leurs statistiques selon la date de l'enregistrement et non selon la date de l'événement; en outre, rares sont ceux qui ont analysé les résultats ainsi obtenus pour déterminer s'ils correspondent bien au niveau de la natalité ou de la mortalité. Comme ces statistiques risquent d'induire gravement en erreur, les pays dont on sait qu'ils établissent leurs statistiques d'après la date de l'enregistrement sont désignés dans les tableaux par une croix (†). L'absence de croix indique donc que les données ont été exploitées selon la date de l'événement, mais, comme on n'a pas de renseignements complets, c'est sans doute surestimer l'importance de cette catégorie de données que d'interpréter toujours ainsi l'absence de ce symbole.

Etant donné que l'influence de cette méthode d'exploitation des données est si inextricablement liée à celle du retard dans l'enregistrement des faits d'état civil, il faudra toujours considérer en même temps le code de qualité qui figure également dans les tableaux retraçant l'évolution à long terme. Evidemment, si l'enregistrement

[15] *Principes directeurs d'un système de statistiques de l'état civil, op. cit.,* p. 18.

[16] *Ibid.,* p. 20.

[17] *Ibid, Principe* 408, p. 21.

est "complet" (C), les effets perturbateurs de cette méthode seront annulés à tous égards. Dans ces conditions, la remarque que l'on vient de faire est moins valable pour les statistiques des décès que pour celles des naissances, car le code sanitaire de la plupart des pays subordonne la délivrance du permis d'inhumer à l'enregistrement du décès; cette condition tend à hâter l'enregistrement. Le symbole a encore moins de sens pour les mariages, dont l'enregistrement, dans de nombreux pays, fait partie de la cérémonie ou doit être effectué dans un délai assez court. Enfin, il perd presque toute signification lorsqu'il est question de morts fœtales, parce que, dans ce cas également, un permis d'inhumer est nécessaire et aussi parce qu'il est assez peu probable qu'il existe des déclarations tardives à ce sujet.

Conséquences sur la comparabilité : Si, comme on l'a déjà noté, l'enregistrement se fait dans un délai très court, la différence entre les statistiques établies selon la date de l'événement et selon celle de l'enregistrement peut être négligeable. En pareil cas, le seul facteur qui limite la comparabilité est la durée des délais légaux accordés pour l'enregistrement courant des faits d'état civil.

En revanche, si l'enregistrement n'a lieu qu'avec un certain retard et si les déclarations tardives sont nombreuses, les statistiques de l'état civil exploitées selon la date de l'enregistrement ne sont pas comparables sur le plan international. Dans les meilleures conditions, les statistiques exploitées selon la date de l'enregistrement comprendront surtout des faits survenus au cours de l'année précédente; dans les pays où le système d'enregistrement n'est pas très développé, elles comprendront bien des événements survenus plus longtemps auparavant. Il ressort de documents concernant les Etats-Unis, le Costa Rica, le Chili et la République Dominicaine que des retards de 20 à 25 ans dans l'enregistrement des naissances ne sont pas rares, bien qu'en général la déclaration se fasse de deux à quatre ans après l'événement. Au fur et à mesure que l'enregistrement deviendra plus complet et se fera plus promptement, les données exploitées selon la date de l'enregistrement se rapprocheront davantage de la réalité pour l'année considérée, mais, en attendant, les statistiques fondées sur les données d'enregistrement ne seront pas comparables sur le plan international.

Il convient également de noter que l'exploitation des données selon la date de l'enregistrement ne compromet pas seulement la comparabilité internationale des statistiques. Même à l'intérieur d'un même pays, ce procédé met en cause la comparabilité des chiffres sur une longue période. Si le nombre des faits d'état civil enregistrés varie dans une mesure quelconque d'une année à l'autre (par suite de la mise en vigueur de mesures destinées spécialement à encourager l'enregistrement ou exigeant la production d'un certificat de naissance ou de décès pour l'accomplissement de certaines formalités), les statistiques de l'état civil établies d'après la date de l'enregistrement ne permettent pas de mesurer le niveau réel de la natalité ou de la mortalité; elles ne peuvent pas davantage fournir d'indications sur la tendance.

Tout ce qu'elles peuvent faire, c'est montrer que les conditions d'exigibilité du certificat de naissance, de décès ou de mariage n'ont pas été uniformes. D'autre part, si la complétude de l'enregistrement, au lieu d'être erratique, est constante d'une année à l'autre ou va en fait en s'améliorant, toute augmentation apparente des taux de natalité et de mortalité peut faire croire à des variations de l'incidence des naissances et des décès. Dans les deux cas, les statistiques des naissances et des décès enregistrés ne présentent qu'une utilité très réduite pour des études nationales ou internationales.

Définition des faits d'état civil aux fins de la statistique

Les diverses définitions adoptées aux fins de la statistique des faits d'état civil expliquent aussi — bien qu'elles jouvent un rôle moins important — le défaut de comparabilité que peuvent présenter les données. Il est important par exemple d'énoncer un critère uniforme et précis permettant de distinguer, du point de vue statistique, les morts fœtales des naissances vivantes.

Dans certains pays, à savoir l'Espagne, Cuba, l'Equateur et les possessions espagnoles de Ceuta et Melilla, il faut que le nouveau-né ait vécu 24 heures après sa naissance pour pouvoir être enregistré dans les naissances vivantes. Les nouveau-nés qui décèdent avant l'expiration des 24 heures sont classés avec les *abortos* et, faute de dispositions statistiques spéciales à cet égard, ne sont comptés ni dans les naissances vivantes ni dans les décès. De même, dans plusieurs autres pays[18], les enfants nés vivants qui décèdent avant l'enregistrement de leur naissance, quel que soit leur âge au moment du décès, sont considérés comme "mort-nés", et sont donc exclus des statistiques de la natalité et de la mortalité.

A moins de classifications spéciales, les statistiques des naissances vivantes et des décès ne tiendront pas compte de ces cas, qui viendront en revanche accroître d'autant le nombre des mortinaissances. En conséquence, les taux de mortinatalité seront supérieurs à la réalité et les taux bruts de natalité et de mortalité seront dans une certaine mesure sous-évalués. Le taux de mortalité infantile sera également faussé, car, bien que les éléments constitutifs du taux (décès d'enfants de moins de 1 an et naissances vivantes) accusent exactement la même insuffisance en valeur absolue, la sous-évaluation est proportionnellement plus grande par rapport aux décès de moins de 1 an et le taux tend à être inférieur à la réalité[19].

Le manque d'uniformité des définitions utilisées par les statisticiens a aussi des répercussions sur la comparabilité des statistiques de la nuptialité et de la divortialité. Bien que le mariage et le divorce soient des actes de caractère juridique plutôt que des faits biologiques, ce qui limite les possibilités de variation des définitions, les différences de concepts d'un pays à l'autre influent sur la qualité des statistiques. On trouvera plus de détails à ce sujet dans le chapitre II de l'*Annuaire démographique* de 1958, qui est spécialement consacré aux statistiques de la nuptialité et de la divortialité.

STATISTIQUES DES NAISSANCES VIVANTES

Comme la présente édition de l'*Annuaire* porte essentiellement sur les statistiques de la mortalité, on a limité les statistiques de la natalité aux données essentielles pour lesquelles la continuité est nécessaire d'année en année, c'est-à-dire aux séries chronologiques et aux naissances classées selon l'âge de la mère. On trouvera ces données aux tableaux 6 et 7 respectivement.

---

[18] Algérie, Belgique, France, Guadeloupe, Martinique, Maroc, Antilles néerlandaises, Réunion, Saint-Pierre-et-Miquelon et Surinam.

[19] Pour un examen critique plus approfondi de ces effets, voir *Manuel de statistique de l'état civil, op. cit.,* chapitre IV.

Pour l'établissement de ces tableaux, la naissance vivante a été définie conformément à la définition internationale donnée dans les *Principes directeurs d'un système de statistiques de l'état civil*[20] et dans l'*Annuaire démographique* de 1959. Les divergences entre les données sont brièvement examinées à propos des tableaux 6 et 7; en ce qui concerne les limitations générales des statistiques des naissances vivantes, voir l'*Annuaire démographique* de 1959, consacré spécialement aux statistiques de la natalité.

STATISTIQUES DE LA MORTALITE FŒTALE

On peut considérer que les statistiques de la mortalité fœtale constituent un prolongement des statistiques de la mortalité, mais on peut également les envisager au point de vue des pertes de vies humaines consécutives aux décès des enfants à la naissance ou aux interruptions de grossesse. En conséquence, on a fait une place plus importante aux tableaux relatifs à la mortalité fœtale, de manière a fournir des renseignements plus complets sur la mortalité, qui est le sujet du présent volume. C'est ainsi que trois tableaux se rapportent à la mortalité fœtale et un à la mortalité périnatale; il s'agit des tableaux 8 à 11.

La définition de la mort fœtale qui sert de base pour l'établissement des statistiques est la définition internationale normalisée[21] :

> *La mort fœtale est le décès d'un produit de la conception lorsque ce décès est survenu avant l'expulsion ou l'extraction complète du corps de la mère, indépendamment de la durée de la gestation; le décès est indiqué par le fait qu'après cette séparation le fœtus ne respire ni ne manifeste aucun signe de vie, tel que battement du cœur, pulsation du cordon ombilical ou contraction effective d'un muscle soumis à l'action de la volonté.*

Les "morts fœtales tardives" sont celles qui sont survenues "au bout de la vingt-huitième semaine de gestation ou au-delà". Il n'y a aucune différence entre ces "morts fœtales tardives" et les faits dont l'ensemble était désigné, avant 1950, par le terme "mortinatalité".

Insuffisance des données

La comparabilité des statistiques des morts fœtales est fortement influencée par des différences de définition aussi bien que par des variations dans la qualité des données et dans les méthodes suivies pour leur exploitation. Ces problèmes sont examinés de façon plus approfondie au chapitre IV du *Manuel de statistique de l'état civil,* mais il n'est pas inutile de rappeler ici un ou deux points particulièrement importants.

Complétude des données

Les statistiques des morts fœtales sont encore plus incomplètes que les données sur tout autre fait d'état civil. Il est évident que, même dans le cadre d'un système particulièrement efficace, une proportion considérablement plus grande des morts fœtales que des naissances vivantes ou des décès échappe à l'enregistrement. Mais il est difficile de mesurer ou d'estimer quelle fraction du total n'est pas enregistrée; de ce fait, on ne trouvera pas dans les tableaux consacrés aux morts fœtales autant de renseignements précis sur la complétude des données que dans les tableaux consacrés aux naissances vivantes et aux décès.

Définition

La comparabilité des statistiques des morts fœtales est fortement influencée par des différences de définition. Ces différences concernent principalement les critères appliqués pour enregistrer comme tels les "mort-nés" ou les "morts fœtales tardives" lorsque l'enregistrement de tous les produits de la conception n'est pas obligatoire, c'est-à-dire les critères de viabilité qui reposent d'ordinaire sur la durée de la grossesse calculée en jours, semaines ou mois. La durée de gestation fixée comme minimum varie considérablement d'un pays à l'autre, allant, d'après les renseignements que l'on a pu recueillir, de trois à sept mois. Le minimum le plus fréquemment retenu est 28 semaines. Dans quelques pays, il faut en outre que le fœtus ait une longueur minimum, celle-ci variant entre 30 et 35 centimètres. Dans un certain nombre de cas, la seule condition requise est que le fœtus soit viable et qu'il puisse être reconnu comme un être humain.

Il a été impossible de réunir des renseignements complets sur la façon dont les "mort-nés" sont définis dans chaque pays et territoire et pour toutes les années pour lesquelles des statistiques de la mortinatalité sont présentées dans ce volume, mais on a quelques indications sur les pratiques actuellement suivies dans la plupart des pays; ces indications sont données dans le tableau 10, où les morts fœtales tardives sont réparties selon la durée de gestation.

Ainsi qu'on l'a déjà fait observer plus haut, certains pays classent avec les mort-nés les enfants vivants décédés peu après leur naissance (et avant l'enregistrement de la naissance). Ces décès assimilés à des mortinaissances peuvent avoir lieu jusqu'à trois jours après la naissance; de ce fait, les statistiques de la mortinatalité ou des morts fœtales tardives peuvent être entachées d'une erreur par excès assez importante. En théorie, et à condition que les pseudo morts-nés et les mort-nés véritables soient comptés séparément, des corrections peuvent être apportées à ces statistiques. C'est ce qui se fait dans certains pays, mais on ne peut ainsi rectifier que les totaux bruts. Les pays qui procèdent ainsi sont signalés dans le tableau 8.

STATISTIQUES DE LA MORTALITE

Etant donné que la mortalité constitue le sujet spécial de la présente édition de l'*Annuaire démographique,* les statistiques de la mortalité occupent 15 des 29 tableaux contenus dans le volume et plus de 70 pour 100 des pages consacrées aux tableaux. Afin de retracer l'évolution de la mortalité à tous âges, de la mortalité infantile, de la mortalité fœtale et de la mortalité périnatale, on a présenté des taux de mortalité pour la période 1945-1959 et des chiffres absolus pour chaque année de la période 1952-1961. Les répartitions par caractéristiques en général couvrent la période 1955-1960. Dans ces conditions, les tableaux de la présente édition et ceux de la dernière édition relative à la mortalité (*Annuaire démographique* de

[20] *Ibid., Principe* 202.
[21] *Principes directeurs d'un système de statistiques de l'état civil, op. cit., Principe* 202.

1957) se chevauchent sur plusieurs années; ces deux éditions donnent l'évolution de la mortalité à tous âges pour la période commençant en 1930.

Pour l'établissement de ces tableaux, le décès a été défini comme suit, conformément aux *Principes directeurs d'un système de statistiques de l'état civil*[22] :

> *Le décès est la disparition permanente de tout signe de vie à un moment quelconque, postérieur à la naissance vivante (cessation des fonctions vitales après la naissance sans possibilité de ressuscitation).*

Par définition, les chiffres ne comprennent pas les morts fœtales, sauf dans un petit nombre de cas — indiqués dans les tableaux — où il y avait de sérieuses raisons de supposer que le nombre des mort-nés était trop faible pour fausser les statistiques.

Normalement, il est tenu compte de tous les décès d'enfants nés vivants, mais, dans certains pays, par suite de la définition légale adoptée pour la naissance vivante (voir plus haut p. 68), les décès d'enfants nés vivants qui sont morts avant l'enregistrement de leur naissance ou dans les 24 heures qui ont suivi la naissance n'entrent pas dans les totaux. Leur exclusion peut avoir des conséquences graves, car les décès qui surviennent dans un délai maximal de trois jours après la naissance (période pendant laquelle la mortalité est assez élevée) risquent d'échapper à l'enregistrement et de ne pas être comptés.

Les données publiées correspondent aux décès survenus dans la population présente à l'intérieur des frontières actuelles du pays. Elles comprennent donc, à priori et sauf indication contraire, les décès qui se sont produits parmi les tribus nomades et les aborigènes, les forces armées étrangères ou nationales, les personnes déplacées, les réfugiés de guerre et les étrangers qui résident dans le pays au moment du décès. Normalement, elles n'englobent pas les décès survenus parmi les forces armées nationales ou les ressortissants civils qui se trouvent en dehors du territoire.

Théoriquement, dans tous les cas où la norme définie ci-dessus est respectée, il serait inutile de donner des notes explicatives. Toutefois, comme la présente édition est consacrée principalement aux statistiques de la mortalité et que certains des tableaux publiés portent sur la période de la seconde guerre mondiale, on s'est efforcé de fournir autant que possible les renseignements disponibles sur les décès de militaires, qu'ils aient été, au moment du décès, stationnés dans leur pays ou ailleurs. Etant donné la "norme", ces notes peuvent sembler redondantes, mais elles permettent d'apprécier plus exactement cet important élément de la mortalité. Cependant, l'absence de note sur l'inclusion ou l'exclusion de certains éléments n'implique pas nécessairement qu'il y a conformité avec la norme, encore que cette hypothèse soit sans doute justifiée dans la plupart des cas.

Comme les lacunes de l'enregistrement des décès sont plus difficiles à déceler ou à évaluer que celles de l'enregistrement des naissances, les colonnes réservées au code dans les tableaux de la mortalité fœtale, de la mortalité périnatale, de la mortalité à tous âges et de la mortalité infantile contiennent plus de signes "inconnu" (. . .) que la colonne correspondante du tableau relatif aux statistiques des naissances. Il est généralement admis que l'enregistrement des décès est plus complet que celui des naissances, mais ce n'est pas nécessairement le cas partout. En fait, des exemples toujours plus nombreux montrent que, dans plusieurs territoires et dans certaines conditions, les naissances peuvent être mieux enregistrées que les décès. Une analyse des données relatives à la période 1951-1955[23] a montré qu'environ 33 pour 100 seulement des décès survenant dans le monde sont enregistrés — le pourcentage variant d'une région à l'autre : de 7 pour l'Asie de l'Est à 100 pour l'Amérique du Nord et l'Europe. Dans le cas des naissances, le rapport correspondant est 42 pour 100.

On a soigneusement vérifié les tableaux par recoupement afin d'éliminer les défauts de concordance. Toutes les différences entre les chiffres ou les taux qui n'ont pu être expliquées ont été signalées dans des notes, quelle que soit leur importance.

TABLES DE MORTALITE

Les tables de mortalité reposent sur les conditions de mortalité observées pendant une certaine période, mais elles permettent d'analyser les incidences et les perspectives découlant de ces conditions de manière plus détaillée que les taux classiques de mortalité.

Les valeurs de trois fonctions principales sont publiées dans le présent *Annuaire démographique* : 1) la probabilité de décès dans le délai d'un an ou dans un intervalle d'âge déterminé pour les personnes d'un âge donné (q_x); 2) les survivants au début de chaque intervalle d'âge sur une génération de 100 000 individus (l_x), et 3) l'espérance moyenne de vie ou nombre moyen d'années restant à vivre pour les personnes d'un âge donné ($\mathring{e}_x$).

Les méthodes d'établissement des tables de mortalité varient quelque peu sur des points de détail selon l'importance et la nature des données de base disponibles. Les données de base sont ordinairement les suivantes : décès au cours d'une période déterminée, classés par âge et par sexe, ainsi que chiffre de la population moyenne de chaque âge et chaque sexe pour la même période. La valeur de q_x, fonction fondamentale de la table de mortalité, est généralement calculée de façon à correspondre aux taux de mortalité des personnes ayant l'âge considéré au cours d'une période déterminée.

La méthode la plus employée consiste à utiliser des statistiques de décès s'étendant sur une période de trois ou cinq ans et choisies de telle sorte que la date du recensement se situe à peu près au milieu de la période; ainsi, les données de recensement peuvent être considérées comme indiquant la population moyenne. Parfois, on considère la période comprise entre deux recensements, et les chiffres de population utilisés sont la moyenne des résultats des deux recensements. Il est courant de procéder à des ajustements pour corriger les erreurs des déclarations d'âge faites lors des rencensements et de l'enregistrement des décès et pour obtenir d'un âge à l'autre une série de valeurs q_x ayant une allure régulière; à l'occasion, les données sont corrigées pour tenir compte des migrations. Dans quelques rares cas (dans l'Inde et au Brésil, par exemple), des tables de mortalité approximatives ont été calculées sans recourir aux données sur les décès; la valeur de q_x a été établie en comparant le chiffre de la population dénombrée dans chaque groupe

[22] *Op. cit., Principe* 202.

[23] Voir l'*Annuaire démographique* de 1956, chapitre I, tableau I, p. 75.

d'âge lors d'un recensement, avec le nombre de survivants au recensement suivant.

Le nombre de personnes appartenant à une même cohorte qui survivent divers âges successifs est obtenu en appliquant à la cohorte initiale fictive (généralement 100 000 personnes) le taux de mortalité de l'âge en question. Le nombre des survivants est représenté par le symbole "l_x", qui exprime l'effectif des "personnes qui survivent à l'âge x".

Le calcul du nombre des survivants (l_x) permet également de déterminer celui des personnes qui meurent dans chaque intervalle d'âge (d_x); des opérations supplémentaires fournissent le nombre des années vécues entre les ages x et $x + 1$ (L_x) ainsi que le nombre cumulatif des années vécues par la cohorte à partir de l'âge x jusqu'au décès du dernier de ses membres (T_x).

Le potentiel moyen de vie des personnes à un âge déterminé ($\mathring{e}_x$) est alors calculé en divisant le nombre total des années vécues (T_x) par celui des survivants à l'âge correspondant (l_x).

Les tables de mortalité ont d'abord été mises au point à des fins actuarielles, mais elles ont de nombreuses applications dans le domaine démographique. Citons parmi celles-ci : 1) l'établissement de prévisions touchant la composition de la population par âge et par sexe; 2) l'analyse des incidences de la mortalité sur la répartition par âge et par sexe d'une population donnée; 3) la comparaison des mesures sommaires de la mortalité, telles que les quotients de mortalité (inverses de l'espérance de vie à la naissance), l'espérance de vie à différents âges, etc.; 4) le calcul des taux nets de reproduction, et 5) l'évaluation de l'exactitude des données tirées des recensements et des registres de l'état civil. En outre, la technique des tables de mortalité a été appliquée à l'analyse d'autres genres de données démographiques, par exemple au calcul des probabilités de mariage, par âge et par sexe, sur la base des chiffres de recensement classés suivant l'état matrimonial.

L'exactitude des tables de mortalité dépend surtout de la précision et de la complétude de l'enregistrement des décès et des dénombrements de population effectués lors des recensements. Les lacunes de l'enregistrement des décès sont probablement plus graves que celles des recensements. Lorsqu'il en est ainsi, les taux de mortalité sont sous-estimés et les valeurs de l_x (survivants) et de $\mathring{e}_x$ surestimées. Les taux de mortalité calculés à partir des statistiques de la population et de la mortalité pour les premiers âges de la vie risquent tout particulièrement d'être sous-estimés, et cette erreur se répercute sur toutes les valeurs de l_x dans la table de mortalité. Comme on l'a déjà indiqué, les taux de mortalité infantile obtenus en rapportant le nombre de décès d'enfants de moins de 1 an au nombre des naissances dans les pays où l'enregistrement est incomplet risquent d'être supérieurs ou inférieurs à la réalité; l'erreur, quel que soit son sens, aura des effets importants sur les valeurs de l_x à chaque âge. L'espérance de vie à la naissance ($\mathring{e}_o$) sera alors également trop élevée ou trop faible.

L'exactitude et la comparabilité internationale des valeurs des tables de mortalité sont particulièrement sujettes à caution pour les âges avancés. Ces valeurs sont tirées de données défectueuses et fréquemment établies par des méthodes assez arbitraires. Certains traits remarquables — par exemple le fait que l'espérance de vie au-delà de 60 ans est souvent beaucoup plus élevée dans les pays où la mortalité est en général forte que dans les pays à faibles taux de mortalité — résultent parfois uniquement des imperfections des tables de mortalité.

La diversité des méthodes utilisées pour établir les tables de mortalité (ajustement des données, etc.) peut compromettre l'exactitude des résultats et nuire à leur comparabilité internationale. Toutefois, elle a sans doute des répercussions beaucoup moins prononcées que les lacunes des recensements et de l'enregistrement des décès.

STATISTIQUES DE LA NUPTIALITE

On trouvera dans la présente édition de l'*Annuaire* des statistiques sur l'évolution de la nuptialité et sur la répartition des mariages selon l'âge du mari et de la femme.

Conformément aux recommandations formulées dans les *Principes directeurs d'un système de statistiques de l'état civil*[24], ces statistiques se rapportent, sauf indication contraire, aux mariages officiels ou unions légales. Les effets des différences de définition, ainsi que les autres facteurs qui limitent la comparabilité, sont examinés brièvement à propos des tableaux 27 et 28; pour une étude plus détaillée de ces facteurs, voir la page 59 de l'*Annuaire démographique* de 1958, dont le sujet spécial était la nuptialité.

STATISTIQUES DE LA DIVORTIALITE

Les séries chronologiques de statistiques relatives aux dissolutions de mariages pour cause de divorce sont présentées dans le tableau 29. Sauf indication contraire, la définition du divorce utilisée pour établir ces statistiques est celle que l'Organisation des Nations Unies a recommandée dans les *Principes directeurs d'un système de statistiques de l'état civil*[25]; en d'autres termes, ces statistiques se rapportent aux dissolutions légales et définitives des liens du mariage conférant aux parties le droit de se remarier.

Les effets des différences de définition, ainsi que les autres facteurs qui limitent la comparabilité, sont étudiés brièvement à propos du tableau 29; pour un examen plus détaillé de ces facteurs, voir les pages 59 et 60 de l'*Annuaire démographique* de 1958, où les statistiques de la divortialité occupaient une place spéciale.

[24] *Ibid., Principe* 202.
[25] *Ibid., Principe* 202

Tableau 1

On trouvera dans ce tableau les résultats des derniers recensements de population, avec répartition selon le sexe, les estimations établies pour 1953 et 1960 (en milliers), des indications sur le type des estimations pour 1960 (voir page 64), le taux d'accroissement annuel moyen de la population (positif ou négatif) en pourcentage pour la période de 1953 à 1960, ainsi que la superficie actuelle et la densité de population de chaque pays et de chaque territoire.

Les pays et les territoires sont classés par continents, dans l'ordre suivant : Afrique, Amérique du Nord, Amérique du Sud, Asie, Europe et Océanie; l'URSS est citée en dernier, puisqu'elle se trouve partiellement en Europe et partiellement en Asie. A l'intérieur de chaque continent viennent d'abord des Etats souverains, énumérés dans l'ordre alphabétique anglais, puis les territoires non souverains classés sous le nom de l'autorité administrante et distingués, par leur statut administratif, en dépendances, territoires sous tutelle, condominiums, zones sous administration militaire, etc.

Le classement géographique et administratif correspond autant que possible à la situation au 31 décembre 1961. Avec les notes abondantes qui définissent les divers territoires d'une manière beaucoup plus détaillée que n'importe où ailleurs dans l'*Annuaire,* il fait du tableau 1 le tableau de référence de tout le volume pour ce qui est de la souveraineté et de la composition territoriale. Ce tableau est également à consulter pour la nomenclature anglaise et française, car les noms de pays y sont donnés sous leur forme officielle la plus récente[26].

Sauf indication contraire, les données de recensement et les estimations se rapportent les unes et les autres à la population présente "rectifiée", qui est définie à la page 62.

Autant que possible, les chiffres inscrits dans la colonne "recensements" du tableau 1 sont les résultats de dénombrements[27] ou d'enquêtes par sondage conçues pour permettre de déterminer l'effectif de la population. Les renseignements dont il est tenu compte n'ont pas à être nécessairement de portée nationale; ils peuvent n'englober qu'une partie du territoire ou qu'une fraction de la population et comporter une erreur par défaut plus ou moins grande. Au contraire, les résultats d'enquêtes démographiques par sondage à comprendre dans les chiffres du tableau 1 doivent fournir une estimation de population qui soit d'ordre national. En conséquence, les résultats d'enquêtes ne portant que sur une fraction du territoire national ne sont pas compris.

Le tableau 1, où sont réunis les résultats de tous les recensements, constitue un bilan général des recensements effectués récemment dans le monde. Il permet d'identifier les pays qui n'ont jamais exécuté de recensement, ceux qui ont effectué des recensements limités et ceux qui ont procédé à de véritables recensements de portée nationale. En présentant les résultats des enquêtes par sondage de portée nationale, on a voulu donner les mêmes renseignements en ce qui concerne cette méthode de plus en plus répandue d'estimation de la population et fournir des chiffres de base pour les territoires dont la population n'a jamais été recensée ou n'a pas été recensée récemment.

Sauf indication contraire, les estimations se rapportent à la population au milieu de l'année considérée, c'est-à-dire au 1er juillet, ou à la moyenne des deux estimations voisines de fin d'année. Aucune distinction n'a été faite entre ces deux catégories d'estimations, les différences en cause étant négligeables.

Lorsqu'on ne disposait pas de chiffres acceptables d'estimations au milieu de l'année ou d'estimations moyennes pour 1953 ou 1960, on a inscrit les résultats d'un recensement de population effectué pendant l'année. On a également substitué dans ce tableau les données de recensement aux estimations dans le cas suivant : lorsque les estimations pour 1960 différaient des résultats du recensement de 1960 ou de 1961, on les a remplacées par le résultat du dénombrement, même s'il se rapportait à 1961. C'est ainsi que, dans sept cas, le tableau 1 présente non une estimation de l'effectif de la population pour 1960, mais la "meilleure estimation" sous la forme du chiffre total dénombré en 1961. Les estimations pour 1953 qui diffèrent des résultats des recensements de 1960 ou 1961 sont accompagnées d'une note. Tous les résultats de recensement sont inscrits en caractère gras pour que le lecteur puisse les distinguer aisément des estimations. Pour la date de référence exacte, il convient de se reporter à la colonne adjacente, où sont indiquées les dates de recensement.

Enfin, dans un ou deux cas où l'on ne disposait ni d'une estimation officielle de la population ni des résultats d'un recensement, on a reproduit des estimations non officielles, pour 1953 et (ou) 1960, afin de donner une idée de l'effectif actuel de la population de chaque unité géographique. Ces estimations non officielles sont précédées du signe x ou d'un chiffre renvoyant à une note de bas de page qui indique la source.

C'est dans le tableau 1 que se trouve le code des types d'estimations, dont la composition est exposée en détail à la page 64. Avec les données sur l'erreur par défaut dans les dénombrements, ce code fournit une base à partir de laquelle on peut se faire une idée assez précise de la qualité des estimations de population pour 1960, où qu'elles soient présentées.

On peut estimer qu'il s'applique aussi — avec moins d'exactitude peut-être — aux estimations pour 1953. Sur la base de cette hypothèse et d'autres renseignements (voir page 64), les estimations pour ces deux années ont été classées en exactes ou douteuses, et celles qu'on estime être douteuses sont reproduites en italique.

On a renoncé au codage dans deux cas : lorsqu'on ne disposait pas d'estimations pour la date courante (1960) et lorsque le chiffre comportait addition ou soustraction d'estimations établies par des méthodes différentes pour diverses parties du territoire. Les estimations qui n'ont pas été codées sont signalées par un point (.). Bien que toutes les estimations autres que celles dont il vient d'être question aient été codées, il convient de noter que le codage des estimations relatives à certaines populations peu nombreuses ne donne pas une bonne indication de leur degré d'exactitude probable. Il en est ainsi parce

[26] Voir page 60.

[27] Pour la définition du recensement et les méthodes de dénombrement, voir *Manuel des méthodes de recensement de la population,* vol. I, *op. cit.,* p. 4, 97 et 108.

que certaines estimations de populations peu nombreuses sont établies par des méthodes qui ne se prêtent pas à ce codage et que l'effectif d'autres populations peu nombreuses subit de violentes fluctuations en raison de la fréquence des entrées et sorties de migrants, de visiteurs, etc., ce qui se traduit par des écarts relativement importants entre population de fait et population de droit, quelles qu'en soient les définitions.

Les données relatives à la superficie — exprimées en kilomètres carrés — correspondent à la superficie totale des unités géographiques considérées, compte tenu des eaux intérieures et des zones inhabitables ou inhabitées que peut comprendre le territoire en question. A quelques exceptions près, les régions entièrement inhabitées, telles que les régions polaires et certaines petites îles, ne sont pas comprises dans les statistiques. Les estimations de superficie sont des chiffres officiels, sauf si elles sont accompagnées du signe x. Les superficies communiquées en milles carrés ont été converties en kilomètres carrés au moyen du coefficient 2,589998.

Portée : Le tableau 1 comprend des données se rapportant à 262 unités géographiques distinctes, c'est-à-dire tous les pays, territoires et parties de territoires comptant au moins 50 habitants. La colonne de gauche de ce tableau est donc la plus complète de l'*Annuaire démographique.*

Calcul des taux

Taux d'accroissement : Le taux annuel moyen de variation (en pourcentage) de la population entre 1953 et 1960 a été calculé à partir des données du tableau 1, à l'aide de la formule ci-après :

$$P_1 = P_0 (1 + r)^t \times 100$$

où P_0 représente la population en 1953

P_1 représente la population en 1960

t est égal à 7 (nombre d'années écoulées entre 1953 et 1960), et

r est le taux annuel de variation.

Les estimations du tableau sont exprimées seulement en milliers, mais, pour le calcul, on a utilisé aussi souvent que possible des nombres à l'unité près, et les taux ont été calculés à deux décimales près et arrondis à une décimale pour la présentation.

Aucun taux n'a été calculé quand les estimations de 1953 paraissaient, jusqu'au chiffre des milliers, identiques à l'estimation de 1960, même lorsque les nombres, exprimés à l'unité près, différaient probablement quelque peu. En pareils cas, on s'est servi du signe point (.) pour indiquer qu'il n'y avait pas lieu de calculer un taux. Contrairement à la pratique suivie dans les éditions antérieures, on a aussi calculé des taux pour les populations de moins de 50 000 personnes. Cette manière de faire a été adoptée pour qu'il y ait concordance avec les tableaux qui montrent la tendance du taux d'accroissement entre les recensements, et où figurent tous les pays et territoires.

Densité : Sauf indication contraire, la densité est égale au rapport de l'effectif total de la population en 1960 à la superficie totale, exprimée en kilomètres carrés. On a calculé cet indice chaque fois que l'on disposait des deux nombres nécessaires. Dans les cas où deux chiffres de superficie sont donnés — l'un se rapportant par exemple à la superficie administrative et l'autre à la superficie habitable —, c'est la superficie habitable que l'on a prise comme base de calcul de densité.

Insuffisances des données : Les données contenues dans ce tableau présentent les mêmes insuffisances que les statistiques de population en général, à savoir absence d'uniformité dans les définitions et les méthodes d'exploitation, défauts de complétude du dénombrement de base et différences dans les méthodes d'établissement des estimations; toutes ces questions ont été examinées précédemment à la page 61. Pour aider à évaluer la comparabilité, on a indiqué, lorsqu'on possédait les renseignements voulus, le degré de complétude des recensements de population; d'autre part, le lecteur pourra se faire une idée de la valeur des estimations en se reportant au code des types d'estimations ainsi que d'après le caractère employé pour l'impression des chiffres. Pour savoir ce que désignent les termes population présente ou de fait et population légale ou de droit, on se reportera au tableau A de l'*Annuaire démographique* de 1960.

Les taux d'accroissement en pourcentage appellent toutes les réserves mentionnées plus haut à propos des estimations de population de base. Dans certains cas, ils représentent seulement le taux qu'il a fallu calculer ou présumer pour établir les estimations elles-mêmes à défaut de figures appropriées de l'accroissement naturel et résultant des migrations[28].

Lorsqu'il s'agit de populations peu nombreuses, l'erreur fortuite peut atteindre à elle seule jusqu'à $\pm$ 0,5. D'autre part, la publication des résultats des recensements de 1960-1961 a permis de constater que certaines des estimations relatives à 1953 étaient trop faibles et, du fait de leur utilisation pour le calcul du taux d'accroissement, ce taux semble être exagéré. Il faut avoir soin d'examiner minutieusement les deux composantes du taux pour éviter toute fausse interprétation. Malgré leur imperfection, ces taux fournissent pour chaque pays et territoire des indications intéressantes qui — utilisées avec les précautions nécessaires — peuvent également servir à évaluer l'exactitude des statistiques de l'état civil et des migrations.

La comparabilité des chiffres de superficie est compromise par tous les facteurs mentionnés à la page 61. Il convient de souligner que les valeurs de la densité de population constituent des indices seulement approximatifs, car elles ne tiennent pas compte de la dispersion ou de la concentration de la population dans certaines zones particulières du pays ou territoire considéré.

Tableau 2

Ce tableau donne des estimations de population comparables, classées par continent et par région, pour 1920 à 1960, avec le taux d'accroissement annuel pour la période de 1950 à 1960, des estimations des taux moyens de natalité et de mortalité pour la période 1956-1960, la superficie en kilomètres carrés et la densité de population en 1960.

Les estimations de population du tableau 2 ont été établies à partir des données officielles du tableau 1; cependant, les chiffres ont été ajustés pour tenir compte des sous-estimations et des surestimations ainsi que des erreurs — par défaut ou par excès — qui ont pu fausser les résultats des divers recensements; ils comportent en

[28] Voir *Annuaire démographique* de 1956, p. 74.

outre des approximations pour les catégories de personnes qui ne sont pas régulièrement comprises dans les statistiques officielles et des estimations pour les pays qui n'ont pas encore fourni de données officielles pour 1960. En conséquence, les totaux partiels — régionaux ou continentaux — ne coïncident pas toujours avec la somme des données reproduites dans le tableau 1. En outre, il a fallu recalculer certaines estimations relatives aux années antérieures, des renseignements recueillis depuis peu conduisant à des résultats différents de ceux qui ont été publiés dans des éditions antérieures de l'*Annuaire*. Les estimations régionales et mondiales de la dernière version du tableau 2 sont donc considérées comme remplaçant tous les chiffres précédemment publiés en la matière. Les chiffres ayant été arrondis, le total mondial et certains totaux régionaux ne sont pas égaux à la somme des composants.

Pour obtenir les superficies régionales, continentales et mondiales, on a fait la somme des superficies des pays et territoires du tableau 1; les chiffres obtenus comprennent donc les eaux intérieures, mais non les zones polaires et quelques îles inhabitées. Pour interpréter les valeurs de la densité de population, il ne faut pas oublier qu'il existe dans la plupart des régions de vastes zones terrestres à peine habitables et que les chiffres publiés ici ne tiennent compte ni des zones inhabitables ni de la dispersion ou de la concentration de la population à l'intérieur des régions considérées.

Portée : Les 14 régions que l'on a distinguées aux fins des statistiques démographiques sont des subdivisions de continents, formées des pays et territoires énumérés au tableau 1. La composition de chaque région est la suivante : elles ont été définies d'après les frontières de fait actuelles et les chiffres donnés pour des années antérieures à 1958 ont été ajustés pour tenir compte des modifications de frontières; ils se rapportent donc à des superficies constantes.

Calcul des taux

Taux d'accroissement : Les taux d'accroissement en pourcentage ont été calculés par la méthode exposée à propos du tableau 1, sauf qu'ici la période (^{t}) correspond à la période décennale 1950-1960 et non à la période septennale 1953-1960.

Taux de natalité et de mortalité : Les estimations des taux moyens de natalité et de mortalité pour la période quinquennale 1956-1960 ont été établies à la faveur d'une étude de l'intervalle de variation des taux calculés à partir de données enregistrées dans chaque pays ou territoire faisant partie de la région étudiée, et compte tenu des estimations officielles de la natalité et de la mortalité que l'on a pu tirer des enquêtes par sondage, des résultats de recensements consécutifs et d'autres renseignements du même ordre. Cette méthode implique un classement par rang d'importance des taux de natalité et de mortalité obtenus à partir des données de l'enregistrement ou estimés dans chaque région; on soustrait le taux de croissance observé pour chaque région du plus bas et du plus haut taux de natalité de la série et on l'ajoute au plus bas et au plus haut taux de mortalité de la série, pour obtenir deux nouveaux taux supposés de natalité et de mortalité compatibles avec les composants; on classe enfin par ordre les quatre taux supposés de natalité et de mortalité et, à l'aide de calculs de moyennes, on arrive à un seul taux de natalité et à un seul taux de mortalité qui, combinés, donnent logiquement la meilleure approximation du taux d'accroissement régional résultant des observations. Les taux par continent sont des moyennes pondérées des taux régionaux. Les divergences importantes constatées entre le taux d'accroissement observé et le taux d'accroissement naturel obtenu selon la méthode décrite ci-dessus ont été imputées au mouvement migratoire; ces cas sont signalés dans les tableaux.

Insuffisances des données : Les estimations de population et les chiffres de superficie du tableau 2 reposent essentiellement sur les données du tableau 1; elles appellent donc toutes les réserves fondamentales formulées à propos de ce tableau.

Les taux d'accroissement et les indices de la densité de population qui en découlent se ressentent eux aussi des insuffisances inhérentes aux données de base. Toutefois, il est à noter que, lorsqu'on additionne des données par territoire pour arriver à des totaux régionaux et continentaux, les erreurs qu'elles comportent arrivent parfois à s'équilibrer, de sorte que les agrégats obtenus sont un peu plus exacts que chacun des éléments dont on est parti.

Vu leur caractère purement estimatif, la plupart des taux de natalité et de mortalité du tableau 2 doivent être considérés uniquement comme des indices commodes pour les usages courants, mais ne sont pas censés mesurer exactement le niveau de la natalité ou de la mortalité. Même dans les cas où ces taux sont calculés à partir de données enregistrées, ils restent sujets à toutes les réserves applicables à ces données (voir p. 64).

Bien qu'ils aient été calculés par la même méthode d'estimation que les taux moyens pour 1951-1955, 1952-1956, 1953-1957, 1954-1958 et 1955-1959, publiés dans les cinq dernières éditions de l'Annuaire démographique, les taux pour 1956-1960 ne doivent être considérés ni comme comparables aux précédents ni comme constituant avec eux une série chronologique. On s'est fondé chaque fois sur les données disponibles au moment de l'estimation et beaucoup d'éléments nouveaux sont intervenus dans le calcul des estimations relatives à 1956-1960.

Tableau 3

L'objet de ce tableau, publié pour la première fois dans l'*Annuaire démographique* de 1958, est de présenter ensemble les taux actuels de natalité, de mortalité, de nuptialité, de divortialité, de mortalité infantile, de fécondité, et d'accroissement naturel, ainsi que les valeurs de l'espérance de vie pour tous les pays et territoires dont les taux de la natalité et de la mortalité sont considérés comme étant de bonne qualité.

Autant que possible, on a retenu les taux relatifs à la dernière année pour laquelle on disposait de données d'enregistrement et, lorsqu'on connaissait le degré de complétude de ces données, on l'a indiqué dans des notes. Lorsque les statistiques établies sur la base des registres de l'état civil étaient discutables et que l'on possédait des estimations relativement exactes des taux de natalité et de mortalité du pays, on a reproduit ces taux estimatifs en signalant leur caractère. On verra que cette dernière formule a été employée surtout dans le cas des pays d'Afrique et d'Asie, où les statistiques de l'état civil sont nettement défectueuses, mais pour lesquels il existe des estimations apparemment satisfaisantes établies sur la base de résultats d'enquêtes démographiques. Ainsi, le tableau 3 permet de trouver rapidement des taux du moment qui sont plus ou moins comparables. Il est à noter toutefois que, faute de place, on n'a pas donné de détails sur leurs particularités et qu'il y a lieu de se reporter aux tableaux retraçant une évolution à long terme pour avoir des renseignements plus précis sur leur portée, leurs insuffisances générales et la base d'exploitation des données.

La date de référence indiquée est la même pour les taux de natalité et de mortalité; si elle diffère pour d'autres taux, on a donné en note les précisions nécessaires.

Portée : Les données du tableau 3 se rapportent à 117 pays et territoires, c'est-à-dire à tous ceux pour lesquels les taux de natalité et de mortalité paraissent être de bonne qualité, soit que 90 pour 100 des naissances et des décès y sont enregistrés, soit que, l'enregistrement y étant incomplet, on dispose néanmoins de bonnes estimations des taux de natalité et de mortalité.

Le tableau 3 ne contient que des données de portée nationale ou concernant de grands groupes ethniques;

les taux relatifs à des grandes villes, à des subdivisions administratives ou à des groupes ethniques secondaires en ont été exclus, son objet étant de fournir des indices que l'on puisse considérer comme représentatifs pour l'ensemble de la population des pays et territoires envisagés.

Calcul des taux : Les taux bruts annuels de natalité, de mortalité, de nuptialité et de divortialité, calculés sur la base des registres de l'état civil, représentent le nombre d'événements enregistrés au cours de l'année civile indiquée pour 1 000 habitants présents dans l'unité géographique considérée au milieu de l'année. Pour les taux établis par estimation, la méthode utilisée, lorsqu'elle est connue, est indiquée dans des notes au bas du tableau.

Les taux de mortalité infantile représentent le nombre de décès d'enfants de moins de 1 an pour 1 000 naissances vivantes survenues pendant la même période, aucun ajustement n'étant fait pour établir la correspondance entre le numérateur et le dénominateur.

Les taux de fécondité sont calculés comme le nombre d'enfants nés vivants, pendant l'année civile, de femmes âgées de 10 à 49 ans pour 1 000 femmes du même groupe d'âge.

Le taux d'accroissement naturel est égal à la différence entre le taux brut de natalité et le taux brut de mortalité.

Insuffisances des données : Etant donné que la plupart des taux et toutes les valeurs de l'espérance de vie du tableau 3 figurent également dans d'autres tableaux de la présente édition ou d'éditions antérieures de l'*Annuaire démographique,* il y a lieu de se reporter aux séries de base correspondantes ainsi qu'au *Manuel de statistique de l'état civil*[30] pour trouver des renseignements détaillés sur les insuffisances des données et les réserves qu'elles appellent.

Pour apprécier la comptabilité des statistiques présentées ici, on devra tout spécialement tenir compte du degré de complétude indiqué par la notation du code de qualité dans chacun des tableaux et dans les notes qui s'y rapportent ainsi que de la base sur laquelle les taux estimatifs ont été calculés. Le manque d'uniformité en ce qui concerne la base d'exploitation des données (par exemple date de l'événement ou date de l'enregistrement) peut également compromettre la comparabilité des données, ce dont il faudra tenir compte pour les comparaisons de pays à pays. Enfin, lorsqu'on voudra comparer divers taux d'un même pays ou ceux de différents pays, il faudra aussi se rappeler que les dates de référence ne sont pas toujours les mêmes.

Tableau 4

Ce tableau donne des estimations de la population totale pour chaque année de la période 1941-1961. Tous les chiffres sont exprimés en milliers, le Bureau de statistique les ayant arrondis au millier le plus proche.

Sauf indication contraire, toutes les estimations se rapportent à la population présente rectifiée du territoire actuel des pays considérés. On trouvera à la page 62 et dans les *Annuaires démographiques* de 1955 et de 1956 des explications détaillées sur cette conception de la population et sur ce qui la distingue de la population de droit. Les principales différences entre la composition des populations dont le chiffre est donné dans le tableau 4 et celle de la population de fait rectifiée telle qu'elle est normalement définie sont indiquées en note. En outre, pour des raisons de clarté et de précision — surtout lorsqu'il s'agit d'années de guerre —, on a indiqué dans le tableau 4 le traitement de certains groupes importants tels que les militaires, même si ce traitement correspond à la norme.

Les estimations se rapportent au milieu de l'année civile indiquée (1er juillet). Lorsqu'on ne disposait d'estimations officielles que pour le 31 décembre, on a calculé la moyenne arithmétique de deux estimations successives de fin d'année et on a reproduit le chiffre obtenu comme s'il s'agissait d'une estimation au milieu de l'année. Dans quelques cas, on a donné dans le tableau les estimations officielles régulièrement établies pour une date autre que le 1er juillet, avec une note indiquant la date à laquelle elles se rapportent.

Chaque fois que l'on n'a pas pu se procurer d'estimation acceptable pour l'année considérée, on a publié des résultats de recensement.

En ce qui concerne les années pour lesquelles on disposait à la fois des résultats d'un recensement et d'une estimation au milieu de l'année, on a retenu le chiffre du recensement lorsque la concordance des deux données paraissait insuffisante.

Tous les résultats de recensements qui figurent dans ce tableau sont reproduits en caractères gras pour que le lecteur puisse facilement les reconnaître.

Par un souci de conformité avec le tableau 1, on a donné une estimation de l'ONU toutes les fois où l'on ne disposait pas, pour 1960, de chiffres officiels au sujet d'un territoire non souverain.

Les séries dont l'exactitude est douteuse sont reproduites en italique. On n'a pas tenté d'évaluer la qualité de chacune des estimations qui composent les séries; au contraire, la classification des estimations autres que les estimations courantes en exactes et en douteuses est fondée sur l'hypothèse que le code relatif au type d'estimation pour l'année précédente est plus ou moins valable pour les estimations des cinq dernières années; on admet ainsi que le code servant à indiquer la qualité des estimations pour la période 1949-1951, qui figure dans l'*Annuaire démographique* de 1952, s'applique également aux estimations remontant jusqu'en 1945 et que les séries qui ont été classées comme exactes en fonction de ces deux codes doivent également avoir été relativement exactes pour les années intermédiaires et les années précédentes. De ce fait, on a attribué aux estimations antérieures qui figurent dans les séries chronologiques une qualité meilleure que celle qu'elles ont probablement eue et on a exagéré l'exactitude des estimations entre 1941 et 1950. Mais étant donné que les critères employés pour déterminer l'exactitude des données courantes sont assez rigoureux, et qu'il n'y a eu que peu de cas où les estimations pour 1949-1951 ont été jugées mauvaises alors que celles de l'année 1960 et des années voisines étaient satisfaisantes, il est probable qu'il n'y a pas eu beaucoup d'erreurs dans le classement qualitatif. Pour plus amples détails sur cette méthode, voir page 64.

Portée : Le tableau 4, qui donne des renseignements pour 221 pays et territoires, est l'un des plus complets de l'*Annuaire.* Il comprend les pays les plus importants, même si

[30] *Op. cit.*

les estimations de population pour la période récente ne portent que sur quelques années. En revanche, les pays et territoires moins importants en sont exclus, sauf si les statistiques les concernant couvrent une période relativement longue.

Le principe du tableau 4 est de donner les chiffres de la population totale et non des totaux partiels.

Insuffisances des données : La comparabilité des estimations de population est limitée par les facteurs mentionnés à la page 62, savoir : le manque d'uniformité dans les définitions de la population de droit et de la population de fait, l'inexactitude des résultats de recensement sur lesquels reposent certaines estimations et la multiplicité des méthodes par lesquelles sont établies les estimations intercensitaires et postcensitaires.

D'une manière générale, on revise, s'il en est besoin, les estimations établies entre deux recensements dès que l'on a connaissance des résultats du dernier recensement.

Il n'en est toutefois pas toujours ainsi, et il en résulte, dans un certain nombre de cas, une nette discontinuité entre les estimations non revisées antérieures au recensement et les résultats du recensement. De plus, du fait que de nombreux recensements de 1960/1961 restent provisoires, les estimations relatives à la période intercensitaire précédente n'ont pas encore été rectifiées.

Pour certaines séries, la nécessité d'une revision semble s'imposer; pour d'autres, les données non revisées ne font apparaître que des discontinuités insignifiantes. Dans l'un ou l'autre cas, il est parfois difficile de savoir s'il existe une véritable discontinuité, lorsque l'estimation a précédé le recensement de plusieurs mois pendant lesquels d'importantes migrations de population ont pu se produire ou lorsque les résultats du recensement sont eux-mêmes encore sujets à revision. Néanmoins, les séries qui comportent une irrégularité marquée de ce genre sont signalées par le signe paragraphe (§) dans la colonne de gauche du tableau et par un trait vertical (|) au point de rupture; l'emploi de ces symboles, ainsi que les caractères en italique dont il est question ci-dessus, indiqueront au lecteur qu'il s'agit d'une série dont l'exactitude est douteuse.

Tableau 5

Le tableau 5 donne les derniers chiffres disponibles sur la répartition de la population selon l'âge et le sexe pour la période 1957-1961. Ces données complètent et prolongent les séries chronologiques portant sur 1940-1960 qui ont été publiées dans l'*Annuaire démographique* de 1960. Etant donné que ces statistiques ne portent que sur la période 1957-1961, elles n'excluent que deux séries qui n'étaient pas jusqu'ici disponibles, à savoir les résultats du recensement effectué en 1955 au Groenland et ceux du recensement fait en 1956 en Chine (Taïwan).

Les données comprennent les résultats de recensements de populations ou des estimations intercensitaires et postcensitaires calculées selon la méthode de l'accroissement naturel. On a substitué une moyenne de deux estimations de fin d'année acceptables à une estimation de milieu d'année quand celle-ci n'existait pas; lorsqu'on disposait d'une seule estimation de fin d'année, on l'a fait figurer dans le tableau. La date de référence du recensement ou de l'estimation figure dans la colonne de gauche du tableau et les résultats des recensements sont de plus distingués par le signe (C), figurant après la date. Les moyennes dont il est question ci-dessus ne sont pas spécialement désignées, sauf lorsque la moyenne obtenue par calcul diffère de l'estimation véritable de mi-année qui figure au tableau 4.

Sauf indication contraire, la répartition par âge repose sur l'âge au dernier anniversaire. Elle comporte les 20 groupes suivants : moins de 1 an, 1 à 4 ans, 5 à 9 ans, et, ainsi de suite, de 5 ans en 5 ans jusqu'à 84 ans; 85 ans et plus; âge inconnu. Ce système est conforme au classement recommandé par l'ONU[31].

Sauf indication contraire, les données se rapportent à la population présente rectifiée se trouvant sur le territoire actuel des pays considérés (voir la définition à la page 62). Si la rectification a porté sur un grand nombre de personnes, une note spéciale fournit des éclaircissements, même si l'estimation obtenue correspond à la norme pour le tableau.

Conformément à la pratique suivie dans l'*Annuaire* de 1959, les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. Le classement des estimations en exactes et en douteuses est fondé sur la méthode employée pour les obtenir, décrite à propos des totaux du tableau 4. On n'a pas tenu compte de l'inexactitude dans les réponses concernant l'âge, dont l'évaluation est présentée à la page 63.

Portée : Le tableau 5 présente, pour 104 pays et territoires, des séries de données sur la population selon l'âge et le sexe, dont 39 ont été fournies par des dénombrements et 65 par des estimations.

La portée du tableau 5 n'a pas été conditionnée uniquement par la possibilité de réunir des données; en effet, on a délibérément exclu un certain nombre d'estimations de population selon l'âge et le sexe à cause des méthodes de calcul sur lesquelles elles reposaient. Pour pouvoir figurer dans le tableau 5, une estimation doit avoir été établie par la méthode de l'accroissement naturel, complétée par les statistiques des migrations s'il en existe. Les répartitions par âge et par sexe obtenues en appliquant à l'estimation de la population totale les pourcentages des divers groupes d'âge pour chaque sexe au dernier recensement ne sont pas acceptables. Il en existe pour la Birmanie, la Bolivie, le Brésil, Ceylan, le Chili, la Colombie, l'Equateur, le Honduras, l'Italie, le Mexique, le Pérou, la République arabe unie, Saint-Christophe-Nièves et Anguilla, Singapour et le Venezuela.

Insuffisances des données : La comparabilité des statistiques de population selon l'âge et le sexe est limitée en premier lieu par le manque d'uniformité dans la définition de la population totale — voir page 62 — et par les lacunes des dénombrements (voir plus haut). L'influence de ces deux facteurs varie selon les groupes d'âge. Ainsi, le dénombrement des jeunes enfants comporte souvent plus de lacunes que celui des personnes plus âgées; de même, la composition de la population totale dépend essentiellement de l'inclusion ou de l'exclusion de certains groupes de personnes appartenant à un groupe d'âge déterminé, par exemple les militaires. Il conviendra de tenir compte de ces facteurs fondamentaux lorsqu'on utilisera les données du tableau 5.

[31] *Principes et recommandations concernant les recensements nationaux de population, op. cit.*, par. 503.

Outre ces difficultés d'ordre général, la comparabilité pose des problèmes particuliers, notamment lorsqu'il s'agit des données par âge. On sait que les répartitions de population selon l'âge présentent certaines imperfections dues aux lacunes du dénombrement des jeunes enfants et à l'inexactitude des déclarations d'âge. Certaines de ces anomalies ont tendance à s'estomper ou à disparaître lorsque l'on classe les données par groupe d'âge quinquennaux, mais les données n'en restent pas moins faussées, même s'il n'est pas toujours facile de voir à quel point il y a distorsion. Un exposé critique sur cette question figure à la page 62.

Le degré de comparabilité dépend également des méthodes employées dans les divers pays pour classer les données selon l'âge. Dans tous les cas où l'on sait que ce classement n'a pas été établi d'après l'âge au dernier anniversaire, mais d'après l'année de naissance, on l'a indiqué en note; il conviendra donc de tenir compte aussi de ce facteur lorsqu'on utilisera les données du tableau. Pour le résultat de cette méthode, voir page 63.

Chaque fois que le classement par âge s'écarte du classement type du tableau, on l'a indiqué par des crochets, ainsi que dans des notes de bas de page. Bien que les divers groupes d'âge ne soient pas toujours parfaitement comparables sur le plan international[32], on a néanmoins publié toutes les données disponibles en raison de l'intérêt qu'elles présentent pour l'étude des pays et territoires en question, en particulier lorsqu'il s'agit de l'Afrique. En effet, il y a peu de temps que l'on possède des renseignements statistiques sur les populations de ce continent et, vu la rareté de ces séries, on a reproduit dans le tableau 5 les résultats de recensements par sondage et des estimations fondées sur d'autres types d'enquêtes.

En ce qui concerne le classement par âge, il est à noter que l'absence de tout chiffre sous la rubrique âge inconnu ne signifie pas toujours que toutes les déclarations d'âge étaient précises; elle est plus souvent l'indice qu'avant d'exploiter les données on a fait, le cas échéant, une répartition arbitraire entre les divers groupes d'âge. Ce mode de répartition n'est pas toujours connu et les tableaux comportent peu de notes qui donnent des indications à ce sujet; toutefois, il ne faut pas oublier que ce procédé peut avoir été employé.

Comme on l'a indiqué à propos du tableau 4, les estimations intercensitaires de la population totale sont d'ordinaire rectifiées, si besoin est, d'après les résultats des recensements de population. Les données concernant la répartition intercensitaire de la population par âge et par sexe ne sont toutefois pas toujours rectifiées de cette manière. Celles qui ne l'ont pas été portent la mention provisoire dans ce tableau; elles ne doivent alors être employées qu'avec une extrême précaution pour l'analyse des séries chronologiques, quoique leur utilité pour l'étude de la structure par âge de la population pour l'année visée reste probablement entière.

Tableau 6

Le tableau 6 présente des données nouvelles et revisées sur l'évolution des naissances vivantes pour les années 1952 à 1961, ainsi que des taux bruts de natalité pour les périodes quinaires comprises entre le début de 1945 et la fin de 1959 et pour chaque année de 1952 à 1961. Pour des raisons d'homogénéité, les moyennes quinquennales qui permettent de suivre l'évolution ont été données dans le tableau 14 concernant l'évolution de la mortalité. Pour la première fois, on a accru la portée chronologique des séries de l'*Annuaire démographique* de manière à y intégrer les données qui pourraient être disponibles pour l'année à laquelle se rapporte le présent volume (1961).

Presque toutes ces données reposent sur l'enregistrement des naissances vivantes par les services de l'état civil. Toutefois, dans un certain nombre de cas où l'on sait qu'il n'existe pas de données d'enregistrement ou que ces données sont discutables, on a publié des taux estimatifs qui représentent sans doute plus fidèlement le niveau réel de la natalité. Ces taux officiels concernant des années particulières ont été établis à partir des résultats de sondages, par l'analyse des données de recensements consécutifs et par inférence. Pour distinguer ces données de celles qui proviennent de registres de l'état civil, on a indiqué la méthode suivie et on a précisé leur nature dans des notes qui contiennent également, chaque fois que faire se peut, le taux correspondant établi sur la base des données d'enregistrement.

Dans le tableau 6 la qualité des données est indiquée par les lettres et signes conventionnels C, U ou . . . , qui figurent dans la première colonne; on a exposé plus haut à la page 65 la manière d'interpréter correctement ce code. Pour les pays qui ont communiqué des évaluations précises, des notes de bas de page signalent en outre le degré de complétude de l'enregistrement exprimé en pourcentage.

Les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. Voir explications à la page 65.

Portée : Les statistiques présentées dans le tableau 6 intéressent au total 207 pays et territoires. Le tableau 6 donne des renseignements sur les principaux pays, même lorsqu'il n'existe pas de données récentes à leur sujet, ainsi que des chiffres se rapportant seulement à certains groupes de population quand il a été impossible d'obtenir des statistiques pour l'ensemble du territoire. Les statistiques concernant les groupes en question n'ont rien de représentatif; on les a retenues seulement pour indiquer les pays et territoires où se rassemblent normalement des statistiques de la natalité.

Calcul des taux : Les taux annuels bruts donnés dans le tableau 6 représentent le nombre des naissances vivantes survenues pour 1 000 habitants selon l'estimation de la population au milieu de l'année. Les taux quinquennaux moyens sont établis en considérant le nombre total des naissances vivantes survenues pendant une période de 5 ans et calculés pour 1 000 habitants pendant la même période. En général, les chiffres de population auxquels ont été rapportés les nombres de naissances sont les estimations officielles au milieu de l'année qui sont reproduites dans le tableau 4.

On s'est toujours efforcé d'établir une correspondance rigoureuse entre le numérateur (naissances) et le dénominateur (population) des taux, et l'on a indiqué, en note, les cas où l'on n'a pas pu y parvenir.

[32] Il y a dans le tableau 5 au moins 56 groupes d'âge qui s'écartent du classement type.

Insuffisances des données : On trouvera ailleurs toutes les explications nécessaires sur les incidences du code de qualité ainsi que sur la classification des données en données de bonne qualité et données discutables à laquelle conduit son application. Pour interpréter les statistiques de ce tableau, il faudra également tenir compte des effets de l'exploitation des données selon la date de l'enregistrement plutôt que selon celle de l'événement. Les pays dont on sait qu'ils établissent leurs statistiques d'après la date de l'enregistrement sont indiqués par une croix (†) figurant dans la même colonne que les notations codiques, ce qui permet d'évaluer immédiatement l'effet combiné des deux facteurs.

Il importe de souligner que, là où le décalage entre l'événement et son enregistrement est grand, c'est-à-dire là où une forte proportion des naissances vivantes fait l'objet de déclarations tardives, comme c'est le cas dans certaines régions d'Amérique latine, d'Asie et d'Afrique, l'exploitation des statistiques des naissances vivantes d'après la date de l'enregistrement peut donner une idée très inexacte, ou même totalement fausse, des tendances de la natalité. Souvent, ces statistiques conduisent à des taux de natalité qui paraissent tout à fait vraisemblables, alors même que l'on sait que bon nombre de naissances n'ont pas été enregistrées. En pareil cas, les lacunes de l'enregistrement sont masquées par l'inclusion de naissances survenues les années précédentes et les chiffres obtenus peuvent conduire à de grosses erreurs d'interprétation, particulièrement en ce qui concerne les caractéristiques de la fécondité.

On a indiqué dans les notes les pays où les statistiques des naissances vivantes ne tiennent pas compte, par définition, des enfants nés vivants et décédés avant l'enregistrement de leur naissance ou dans les 24 heures qui ont suivi la naissance. Cette exclusion conduit à sous-estimer la natalité; l'importance générale de cette erreur est discutée dans le *Manuel de statistique de l'état civil*[33]; son incidence sur les taux concernant la Guadeloupe et la Martinique est indiquée en note.

Abstraction faite de leurs insuffisances, les taux bruts de natalité permettent de mesurer l'augmentation brute de la population. Ils peuvent également donner une idée générale des tendances de longue période dans un pays ou un territoire donné, ainsi que des indications permettant de classer approximativement les pays selon le niveau de la natalité. Mais, comme la structure de la population selon l'âge et le sexe varie d'un pays à l'autre, les taux bruts ne traduisent pas exactement les différences de fécondité et ne permettent donc pas, à eux seuls, d'évaluer la tendance présente ni de prévoir les mouvements futurs.

Tableau 7

Le tableau 7 est consacré aux naissances vivantes selon l'âge de la mère. Les groupes d'âge représentés sont: personnes de moins de 15 ans, groupes quinquennaux jusqu'à 49 ans, puis 50 ans et plus, et enfin âge inconnu. Comme dans les autres tableaux où il existe une classification par âge, l'âge est calculé au dernier anniversaire ou en années révolues.

Les données qu'on estime être discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. Voir explications à la page 65.

[33] *Op. cit.*, chapitre IV.

Portée : On a publié dans le tableau les dernières données qu'on a pu se procurer sur ce sujet, nouvelles ou rectifiées, pour 111 pays et territoires annonçant 50 naissances ou plus même dans le cas où elles se rapportent à des années assez anciennes. Ce tableau peut donc être considéré comme un index des pays qui classent les naissances vivantes d'après l'âge de la mère et fournir également des indications précieuses sur le degré d'actualité de ces statistiques.

Insuffisances des données : La comparabilité de ces données est affectée par des différences dans la méthode d'exploitation, c'est-à-dire d'après la date de l'événement ou celle de l'enregistrement. Une croix (†) dans la colonne de gauche du tableau indique les pays qui établissent leurs statistiques d'après la date de l'enregistrement et les conséquences de ce procédé ont déjà été exposées à la page 66.

Comme ces statistiques sont classées par âge, elles sont affectées des mêmes limitations en ce qui concerne l'exactitude des déclarations d'âge que celles déjà mentionnées à propos de la répartition de la population selon l'âge et le sexe. Si aucun nombre ne figure dans la colonne réservée aux âges inconnus, cela ne signifie pas nécessairement que la transmission et l'exploitation des données par âge aient été tout à fait exactes. C'est souvent une indication que l'on a attribué un âge aux personnes "d'âge inconnu" avant l'exploitation des données ou qu'elles ont été réparties proportionnellement entre les différents groupes après cette opération. D'autre part, lorsque le nombre des personnes d'âge inconnu est important, cela peut signifier que le pourcentage des naissances illégitimes est élevé, du fait qu'en pareil cas l'acte de naissance ne contient pas toutes les caractéristiques concernant les parents.

Il importe de ne pas oublier non plus, lorsqu'on utilisera ces données, que l'on calcule parfois l'âge de la mère à la naissance de l'enfant (ou à l'enregistrement de cette naissance) sur la base de l'année de naissance seulement et d'après la date exacte (jour, mois et année) de naissance de la mère. Des renseignements à ce sujet sont fournis en note chaque fois que faire se peut.

Le défaut de comparabilité, à la fois entre les données de ce tableau se rapportant à des pays différents et ces données et celles du tableau 6, est dû à un certain nombre de causes. Quelquefois, les données selon l'âge se rapportent aux accouchements plutôt qu'aux naissances vivantes; en outre, dans certains cas, les accouchements en question correspondent seulement à ceux d'enfants nés vivants tandis que, dans d'autres, ils concernent les accouchements d'enfants nés vivants et de mort-nés. Certains pays ne répartissent que les naissances légitimes par âge de la mère alors que les nombres relatifs aux naissances vivantes du tableau 6 se rapportent à toutes les naissances, légitimes ou non. Dans la plupart des cas cette restriction est peu importante, mais lorsque les naissances illégitimes sont relativement nombreuses, on ne peut considérer les données limitées aux seules naissances légitimes comme significatives. De même, dans d'autres pays, la répartition des naissances vivantes par âge de la mère ne porte que sur les enfants nés vivants qui ne sont pas décédés avant l'enregistrement de leur naissance, tandis que les totaux du tableau 6 comprennent ceux qui sont décédés avant l'enregistrement.

Lorsque les statistiques de la natalité sont établies selon la date de l'enregistrement et non de l'événement, l'âge

de la mère représente presque toujours son âge à la date de l'enregistrement et non à la date de la naissance de l'enfant. Ainsi, dans les pays où l'enregistrement des naissances est tardif — le retard atteignant souvent plusieurs années — il est évident que la répartition selon l'âge de la mère ne présente guère d'utilité comme indice de la structure actuelle de la natalité.

Tableau 8

Le tableau 8 présente des données nouvelles et revisées sur l'évolution des morts fœtales tardives pour les années 1952 à 1960, ainsi que des rapports moyens de mortinatalité pour les périodes quinaires comprises entre 1945 et 1959 et pour chaque année de 1952 à 1960. Toutes ces données sont tirées des renseignements sur la mortinatalité fournis par les registres de l'état civil.

Aux fins du tableau 8, mort fœtale tardive s'entend du décès d'un fœtus survenant après 28 semaines complètes de gestation au moins, mais avant l'expulsion complète du corps de la mère. Chaque fois que l'on a pu déterminer en quoi les statistiques présentées s'écartent de cette définition, on l'a indiqué dans une note. On n'a pas de renseignements complets et précis sur la façon dont les mort-nés sont définis dans tous les pays et territoires ni pour toutes les années auxquelles se rapportent les statistiques, mais le lecteur pourra consulter sur ce point le *Manuel de statistique de l'état civil*[34].

Conformément à la pratique habituelle, le symbole (C, U ou . . .) qui figure dans la première colonne du tableau, indique la qualité des données; en outre, les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. Voir explications à la page 65.

Portée : La nomenclature du tableau 8 comprend 139 pays et territoires. On trouvera dans ce tableau des renseignements sur les principales unités géographiques, même lorsqu'il n'existe pas de données récentes à leur sujet, ainsi que des chiffres se rapportant à certains groupes de population seulement, quand il a été impossible d'obtenir des statistiques pour l'ensemble du territoire. Les statistiques concernant les groupes de population n'ont rien de représentatif; on les a retenues seulement pour indiquer les pays et territoires où l'on établit normalement des statistiques de la natalité.

Comme les rapports calculés à partir de très petits nombres comportent souvent des erreurs importantes, on a exclu quelques pays pour lesquels les fréquences étaient toujours inférieures à 15. Des rapports sont indiqués pour tous les autres pays, encore qu'ils soient, dans certains cas, sujets à caution. Puisque les nombres absolus correspondants apparaissent aussi dans le tableau, il n'a pas été nécessaire d'appeler l'attention sur les rapports calculés à partir de fréquences comprises entre 15 et 50. Avant de tirer des conclusions des rapports indiqués, le lecteur se reportera naturellement aux nombres absolus.

Calcul des rapports : Les rapports publiés dans le tableau 8 représentent le nombre de morts fœtales tardives déclarées pour 1 000 naissances vivantes survenues pendant la même période. Les rapports quinquennaux moyens sont établis en considérant le nombre total des morts fœtales tardives survenues pendant une période de 5 ans et calculés pour 1 000 naissances vivantes qui se sont produites pendant la même période. Conformément aux recommandations de l'ONU[35], ce sont les naissances vivantes et non la somme des naissances vivantes et des morts fœtales tardives que l'on a retenues comme dénominateur.

Tous les rapports ont été calculés au Bureau de statistique de l'ONU, sur la base des naissances vivantes du tableau 6, sauf les rapports officiels pour la *Proclaimed Area* (région à régime spécial) de Ceylan, où les données sur les naissances vivantes correspondant aux morts fœtales faisaient défaut, et les rapports de certaines années pour le Ghana, où l'on ne disposait d'aucun des deux éléments.

Insuffisances des données : On sait que les morts fœtales sont incomplètement enregistrées dans la plupart des pays; aussi les données sont-elles reproduites en italique dans presque tous les cas. Cependant, il convient de remarquer que, si l'enregistrement est défectueux à la fois pour les morts fœtales et pour les naissances vivantes, les rapports de mortinatalité peuvent être tout à fait raisonnables. En fait, c'est parfois pour les pays où l'enregistrement des naissances vivantes laisse le plus à désirer que les rapports de mortinatalité sont le plus élevés, ce qui masque l'incomplétude des données de base. Aussi, pour porter un jugement sur la qualité des rapports de mortinatalité, il ne faut jamais oublier que la complétude de l'enregistrement des naissances—comme celle de l'enregistrement des morts fœtales tardives—peut varier sensiblement.

En dehors des effets indirects des lacunes de l'enregistrement des naissances vivantes, il arrive que les rapports de mortinatalité soient sérieusement faussés lorsque l'exploitation des naissances se fait d'après la date de l'enregistrement. Si le nombre des naissances vivantes enregistrées vient à varier notablement d'une année à l'autre par suite de modifications de la législation ou parce que des groupes importants de population ont un intérêt particulier à posséder une attestation de naissance, les rapports de mortinatalité varient également, mais en sens contraire. Il convient donc d'utiliser avec prudence les données des pays où les statistiques sont établies d'après la date de l'enregistrement, à moins qu'on ne sache aussi que les données exploitées d'après la date de l'enregistrement diffèrent peu de celles qui sont exploitées d'après celle de l'événement.

Enfin, on notera que l'inclusion parmi les mort-nés des enfants nés vivants qui meurent avant l'enregistrement de leur naissance conduit à des rapports de mortinatalité exagérés parce que le dénominateur (nombre des naissances) se trouve alors diminué et le numérateur (morts fœtales) augmenté. Il importe de ne pas négliger ce facteur lorsqu'on utilise les données du tableau 8. Les effets éventuels en sont exposés aux pages 61-64 du *Manuel de statistique de l'état civil*[36].

Tableau 9

Ce tableau, qui paraît pour la première fois dans l'*Annuaire démographique,* indique la répartition des morts fœtales tardives selon le sexe ainsi que les pourcentages des mortinaissances illégitimes. Il est analogue au tableau correspondant des naissances vivantes (tableau 10 qui

[34] *Op. cit.*, chapitre IV, annexe 3.

[35] *Ibid.*

[36] *Op. cit.* p. 61-64.

figure dans l'édition de 1959 de l'*Annuaire démographique*) mais il ne contient que les pourcentages des mortinaissances classées comme illégitimes, à l'exclusion des taux d'illégitimité.

Mort fœtale tardive s'entend du décès d'un fœtus survenant après 28 semaines complètes de gestation au moins, mais avant l'expulsion complète du corps de la mère. Chaque fois que l'on a pu déterminer en quoi les statistiques présentées s'écartent de cette définition, on l'a indiqué dans une note.

"Illégitimité" s'entend du statut juridique d'illégitime mentionné sur la déclaration de mort fœtale, en d'autres termes du statut juridique d'un fœtus "né hors mariage" selon la définition qu'en donne la loi de chaque pays. En conséquence, les mortinaissances illégitimes comprennent (sans indication contraire) toutes les mortinaissances résultant d'unions consensuelles ou d'unions qui n'ont pas été célébrées dans les formes légales, une cérémonie religieuse ayant, par exemple, remplacé la cérémonie civile prescrite par la loi, c'est-à-dire toutes les mortinaissances survenues hors mariage. Aux fins du classement statistique, les mortinaissances dont la légitimité n'est pas établie sont considérées comme des mortinaissances illégitimes.

Les morts fœtales tardives de sexe inconnu sont comprises dans les données concernant les deux sexes et non dans celles qui se rapportent à l'un ou l'autre sexe.

Les données discutables (incomplètes) où dont le degré d'exactitude n'est pas connu sont reproduites en italique. Voir explications à la page 65.

Portée : Les données du tableau 9 sur les morts fœtales tardives selon le sexe se rapportent à 113 pays et territoires; le nombre et le pourcentage des mortinaissances indiquées comme illégitimes sont présentés pour 62 unités géographiques. On trouvera dans le tableau 9 des renseignements sur tous les principaux pays quelle que soit la période à laquelle se rapportent les données, ainsi que des chiffres concernant seulement certains groupes de population, quand il a été impossible d'obtenir des statistiques représentatives pour l'ensemble du territoire.

Calcul des rapports : Les pourcentages représentent le nombre des mortinaissances illégitimes pour 100 mortinaissances des deux sexes déclarées pendant la même année.

Insuffisances des données : Les statistiques des morts fœtales tardives sont sujettes à toutes les limitations que comportent habituellement les statistiques de l'état civil et les statistiques des morts fœtales (voir respectivement pages 64 et 68).

Les différences plus ou moins profondes que présente, d'un pays à l'autre, la définition juridique de l'illégitimité constituent la principale limitation à la comparabilité des statistiques d'illégitimité. Dans la plupart des pays, ne sont illégitimes que les enfants nés ou mort-nés de mères non mariées; les enfants nés ou mort-nés d'une femme mariée et d'une personne autre que le mari sont réputés issus d'une union légale et par conséquent légitimes; ce n'est qu'exceptionnellement que ces naissances sont déclarées illégitimes.

Il existe également un autre élément d'hétérogénéité dans la définition de l'illégitimité : en effet, dans certains pays, la loi prend en considération la situation matrimoniale des parents au moment de la conception du fœtus; dans d'autres, au moment de l'accouchement, dans d'autres enfin, au moment de l'enregistrement de la naissance. Le mariage des parents entre le moment de la conception et celui de l'accouchement a pour effet de légitimer la naissance dans la plupart des pays.

La comparabilité des statistiques des naissances illégitimes est également influencée par l'attitude de la société à l'égard de l'illégitimité. L'illégitimité sera plus ou moins souvent celée ou la déclaration mensongère selon que la mère appartient à un milieu qui réagit défavorablement ou qu'elle a les ressources nécessaires pour se soustraire à ce milieu avant l'accouchement.

Les conditions que l'union doit remplir pour que la naissance soit légitime varient également d'un pays à l'autre. Dans la plupart des pays, le mariage religieux n'a pas de valeur légale s'il ne s'accompagne pas d'une cérémonie civile. En conséquence, tout enfant né ou mort-né d'une union qui n'a pas été célébrée civilement est considéré comme illégitime aux yeux de la loi même si le mariage est généralement tenu pour valable dans la collectivité.

Le même problème se pose pour les pays où les unions consensuelles sont reconnues par la coutume. Lorsque le nombre de ces unions est important par comparaison avec celui des mariages légaux (en raison de la tradition sociale ou tribale ou pour tout autre motif), le pourcentage des naissances "illégitimes" par rapport au total des naissances est également élevé.

Malgré les problèmes que pose la détermination du caractère "légitime" ou "illégitime" des mortinaissances, les pourcentages permettent de savoir si les mortinaissances "illégitimes" sont à l'origine de l'accroissement du nombre total ou si le rapport des mortinaissances illégitimes à l'ensemble des mortinaissances reste le même. Ces renseignements peuvent contribuer à circonscrire le problème.

Tableau 10

Le tableau 10 indique le nombre des morts fœtales ainsi que les rapports de mortalité fœtale correspondants selon la durée de gestation pour chaque année de la période 1952-1960. Ce tableau a été publié pour la première fois dans l'*Annuaire démographique* de 1957 en même temps que les données sur la mortalité et de nouveau dans celui de 1959 parallèlement aux données sur la natalité. Compte tenu des tableaux publiés précédemment, le tableau 10 permet d'obtenir des séries portant sur la période 1949-1960.

Sauf indication contraire, on entend par "durée de la gestation", conformément aux recommandations de l'ONU[37], *le nombre de semaines entières qui se sont écoulées entre le début de la dernière menstruation et la date de l'accouchement.* Lorsque la durée de la gestation était exprimée en mois — mois civils ou lunaires —, on a fait la conversion en semaines conformément au tableau ci-après :

1—4 mois	=	moins de 20 semaines
5 mois	=	20—23 semaines
6 mois	=	24—27 semaines
7 mois	=	28—31 semaines
8 mois	=	32—35 semaines
9 mois	=	36—39 semaines
10 mois	=	40 semaines et plus

[37] *Principes directeurs d'un système de statistiques de l'état civil, op. cit.,* Principe 309 c) 23).

Les morts fœtales ont été réparties en huit groupes selon la durée de la gestation, à savoir : moins de 20 semaines, 20-27 semaines, 28-31 semaines, 32-35 semaines, 36 semaines, 37-39 semaines, 40 semaines et plus et durée inconnue. Ce classement est conforme à celui qui a été recommandé par l'Organisation des Nations Unies, mais il est plus détaillé[38]. Toute dérogation à cette règle est indiquée au moyen d'un trait horizontal et d'une note de bas de page; trois points (...) dans les colonnes correspondant aux durées les plus courtes indiquent que ce sont les morts fœtales tardives ou intermédiaires et non l'ensemble des morts fœtales dont la répartition est donnée dans le tableau.

Les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. Voir explications à la page 65.

Portée : Le tableau 10 comprend des séries pour 32 pays et territoires; elles comprennent toutes les données actuellement disponibles.

Calcul des rapports : Les rapports représentent le nombre de morts fœtales survenues pour chaque groupe de durée de gestation pour 1 000 naissances vivantes pendant la même année. On a pris pour base les naissances vivantes et non la somme des naissances vivantes et des morts fœtales parce qu'on a jugé que cette base était plus stable dans le temps et se prêtait mieux à des comparaisons valables entre pays; on trouvera à la page 68 de plus amples détails à ce sujet.

En prenant le total des naissances vivantes pour base de calcul des rapports correspondant à chaque période de gestation, on devrait obtenir une série de rapports, dont la somme donnerait le rapport correspondant à l'ensemble des morts fœtales; cependant, il n'en est pas toujours ainsi, car il y a un assez grand nombre de morts fœtales pour lesquelles la durée de la gestation n'est pas connue. Il existe certes des méthodes qui permettent de répartir ces morts par période de gestation mais on n'y a pas eu recours pour l'établissement du tableau 10.

Insuffisances des données : Les données sur les morts fœtales sont probablement les plus inexactes de toutes les statistiques de l'état civil; les insuffisances générales de ces données ont été exposées à la page 68 et les réserves qu'appellent tout particulièrement les statistiques des morts fœtales tardives sont mentionnées à la page 79.

Le principal facteur qui limite la comparabilité des statistiques est l'hétérogénéité des faits étudiés. Pour quelques pays et territoires, il s'agit en principe de "l'ensemble des morts fœtales, indépendamment de la durée de gestation"; pour bon nombre d'autres, cependant, la statistique établie est celle des "morts fœtales tardives", c'est-à-dire de celles qui surviennent après 28 semaines de gestation ou plus; pour d'autres, la statistique portera sur les morts fœtales intermédiaires et tardives, c'est-à-dire sur celles qui sont survenues après 20 semaines de gestation ou plus, et pour d'autres encore, sur les morts fœtales survenues après trois mois de gestation au moins. Etant donné ces différences et les lacunes fondamentales de l'enregistrement, il n'y a pas de base solide sur laquelle on puisse comparer les taux de différents pays. Dans l'état actuel des choses, la principale raison pour laquelle on a présenté des statistiques des morts fœtales selon la durée de gestation est que ces statistiques peuvent aider à définir plus clairement le contenu d'autres tableaux consacrés aux morts fœtales, montrer dans quelle mesure les morts fœtales ne sont pas déclarées lorsque la durée de gestation était courte et donner, pour certains pays, une indication de la répartition relative des morts fœtales selon la durée de gestation.

[38] *Ibid.*, Principe 410 e) 18).

Tableau 11

Ce tableau qui paraît pour la première fois dans l'*Annuaire démographique* retrace l'évolution de la mortalité périnatale et des rapports correspondants pour la période 1952-1960[39].

Le taux de mortalité périnatale permet de mesurer le risque de décès aux alentours de la date de l'accouchement, c'est-à-dire immédiatement avant, pendant ou peu de temps après la naissance. S'il en est ainsi c'est parce que l'on admet que les facteurs agissant sur la mortalité néonatale ont beaucoup plus d'affinités avec ceux qui conditionnent la mortalité prénatale qu'avec ceux qui déterminent en général la mortalité infantile postnéonatale. De plus, on est justifié à établir des données composites car on peut à bon droit supposer qu'un certain nombre des décès survenus au cours des premiers jours qui suivent la naissance sont, par négligence et parfois volontairement, enregistrés et classés comme morts fœtales et non comme naissances vivantes suivies de mort néonatale et que les données obtenues en combinant ces deux séries ne sont donc pas entachées des erreurs par défaut ou par excès qui sont censées fausser l'une et l'autre des deux séries en question.

Aux fins du présent tableau, "périnatal" qualifie la période comprenant l'existence prénatale après le début de la viabilité, la durée de l'accouchement et le début de la vie extra-utérine[40]. Pour des commodités de calcul, on a fixé la limite inférieure de la viabilité à 28 semaines complètes de gestation; dans ces conditions les morts fœtales tardives, auxquelles le tableau 8 est consacré, constituent un élément constitutif des données publiées. L'autre élément, qui se rapporte au "début de la vie extra-utérine" est la mortalité correspondant aux premiers six jours suivant la naissance qui est appelée mortalité néonatale précoce; ces données figurent également au tableau 15.

Conformément à la pratique usuelle, la qualité des données déduite des tableaux 8 et 15 est indiquée par les lettres ou signes conventionnels C, U ou . . . dans la première colonne et les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique; voir explications à la page 65.

Portée : Le tableau 11 contient des données se rapportant à 96 pays et territoires; cette portée constitue en quelque sorte le plus large ensemble commun aux tableaux 8 et 15. Tous les pays importants figurent dans la nomenclature

[39] On trouvera une brève analyse de l'évolution de la mortalité périnatale dans l'*Annuaire démographique* de 1957 (p. 56 et 57); les données classées par cause de décès pour la période 1950-1955 figurent dans la publication de l'Organisation mondiale de la santé intitulée : *Rapport épidémiologique et démographique*, vol. 10, *v* n° 11-12, 1957.

[40] Cette définition a été adoptée par le Groupe d'étude sur la Mortalité périnatale constitué par le Bureau régional de l'OMS pour l'Europe, lors de sa première réunion tenue à Bruxelles, du 17 au 23 septembre 1953 (Document MH/EUR/74.54, Genève, 1954, miméographié).

du tableau, même ceux pour lesquels on ne possède pas de données récentes; en l'absence de statistiques pour l'ensemble d'un pays, on a présenté des données pour des groupes de population non représentatifs.

Calcul des rapports : Les rapports représentent le nombre des morts périnatales déclarées chaque année pour 1 000 naissances vivantes enregistrées pour la même période. Ces rapports constituent donc la somme des rapports de mortinatalité figurant au tableau 8 et des taux de mortalité pour les décès de moins de 7 jours présentés au tableau 13.

Insuffisances des données : Abstraction faite des insuffisances imputables à l'enregistrement imparfait des décès survenus au cours des premiers jours qui suivent la naissance — décès qui sont par définition éliminés — on doit tenir compte de toutes les insuffisances propres aux statistiques de la mortalité fœtale, de la mortalité infantile et des naissances vivantes (voir pages 79, 82 et 77 respectivement) si l'on veut évaluer la comparabilité internationale des statistiques périnatales[41].

Le fait que la complétude de l'enregistrement des morts fœtales varie d'un pays à l'autre est peut-être le facteur qui nuit le plus à la comparabilité internationale des données. En même temps, il est à noter que la durée de gestation minimum sur laquelle repose l'établissement des statistiques nationales des morts fœtales tardives n'est pas uniforme. C'est ainsi que l'on fait entrer en ligne de compte tantôt les morts fœtales survenues après 28 ou même 20 semaines de gestation tantôt toutes les morts fœtales quelle que soit la durée de la gestation. Lorsque la limite est connue, on l'a indiquée dans le tableau, mais il convient de souligner que la portée de la définition de la mort fœtale tardive n'est pas toujours très nette et que la répartition selon la durée de la gestation qui permettrait de vérifier ces limites n'est pas encore connue pour tous les pays et territoires.

Une autre cause d'hétérogénéité dont il a déjà été question est constituée par les différences que présente la limite supérieure du second élément, c'est-à-dire la fraction des décès de moins de 1 an entrant en ligne de compte dans l'établissement des données. En principe, le tableau 11 doit comprendre les décès survenus au cours de la première semaine mais dans bien des cas la répartition de la mortalité infantile selon l'âge ne fournit pas de données sur la mortalité ainsi définie mais sur la mortalité jusqu'à 10 ou 14 jours.

Le manque de complétude de l'enregistrement des naissances vivantes nuit indirectement à la comparabilité des taux de mortalité périnatale en ce sens que les rapports de mortalité périnatale comportent une erreur par excès du fait que les chiffres des naissances qui en constituent le dénominateur sont discutables. De même, l'exploitation des statistiques des naissances vivantes selon la date de l'enregistrement et non celle de l'événement peut exercer un effet défavorable sur les rapports. En outre, en excluant des statistiques des naissances vivantes les données concernant les enfants décédés peu de temps après leur naissance et enregistrés de ce fait comme mort-nés, on peut accroître artificiellement les rapports de mortalité périnatale du fait que le dénominateur ne correspond pas au numérateur.

[41] On trouvera une étude plus détaillée de cette question dans *Mortalité fœtale, mortalité des enfants du premier âge et mortalité des jeunes enfants,* 2 vol. Document ST/SOA/SER.A/13/Add.1 (Publication des Nations Unies, n° de vente : 1954.IV.8).

Tableau 12

Le tableau 12 présente des données nouvelles et revisées sur l'évolution des décès de moins de 1 an pour les années 1952 à 1961 ainsi que des taux moyens de mortalité infantile pour les périodes quinaires comprises entre 1945 et 1959 et pour chaque année de 1952 à 1961. Pour la première fois, on a étendu la portée chronologique des séries de l'*Annuaire démographique* de manière à y intégrer les données qui pourraient être disponibles pour l'année à laquelle se rapporte le présent volume (1961).

Les statistiques sur la mortalité infantile reposent généralement sur l'enregistrement des décès par les services de l'état civil. Toutefois, dans un certain nombre de cas où l'on sait qu'il n'existe pas de données d'enregistrement ou que ces données sont discutables, on a publié des taux estimatifs qui représentent sans doute plus fidèlement le niveau réel de la mortalité infantile. Ces taux officiels concernant des années particulières ont été établis à partir des résultats de sondages, par l'analyse des données de recensements consécutifs et par inférence. Pour distinguer ces données de celles qui proviennent de registres de l'état civil, on a indiqué la méthode suivie et on a précisé leur nature dans des notes qui contiennent également, chaque fois que faire se peut, le taux correspondant établi sur la base des données d'enregistrement.

Conformément à la pratique habituelle, le symbole (C, U ou . . .) qui figure dans la première colonne du tableau indique la qualité des données; en outre, les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. Voir explication à la page 65.

Portée : Les données de ce tableau se rapportent à la population présente dans les 190 pays et territoires qui ont fourni des statistiques récentes sur la mortalité infantile. Dans certains cas, les chiffres ne concernent qu'une fraction de la population; bien qu'ils ne soient pas très représentatifs, on les a reproduits pour donner une idée de la statistique des décès d'enfants dans l'ensemble du monde.

Calcul des taux : Calculés suivant la méthode classique, les taux annuels de mortalité infantile publiés dans le tableau 12 représentent le nombre de décès d'enfants de moins de 1 an pour 1 000 naissances vivantes survenues pendant la même période. Les taux moyens quinquennaux sont calculés d'après le nombre total des décès de moins de 1 an survenus pendant 5 ans pour 1 000 naissances vivantes qui se sont produites pendant la même période. Autrement dit, il n'est pas tenu compte du fait que certains des décès qui se produisent pendant une année donnée sont ceux d'enfants nés au cours de l'année précédente. Toutefois, l'erreur n'est pas grave, à moins que le nombre des naissances vivantes ou des décès d'enfants de moins de 1 an ne varie rapidement[42].

Insuffisances des données : Si la comparabilité des taux de mortalité infantile est limitée, c'est surtout et le plus souvent parce que les statistiques des décès d'enfants de moins de 1 an et des naissances vivantes sont établies d'après la date de l'enregistrement et non celle de l'événement.

[42] Pour un exposé critique plus détaillé sur ce problème, voir "Mesure de la mortalité infantile" par W.P.D. Logan, *Bulletin démographique des Nations Unies,* Département des questions sociales, Division de la population, Document ST/SOA/SER.N/3, octobre 1953, p. 32 à 72 (n° de vente : 1953.XIII.8).

Quand, pour une raison quelconque, le nombre des naissances vivantes enregistrées pendant une année donnée augmente fortement, il peut en résulter des erreurs considérables dans les taux de mortalité infantile, d'autant plus que les décès sont, en règle générale, déclarés plus rapidement que les naissances.

Si le retard apporté à l'enregistrement reste presque constant et s'il est à peu près le même pour les naissances et pour les décès, les taux ne sont pas faussés trop sensiblement. Mais si une grande partie des naissances ne sont enregistrées qu'après plusieurs années, comme c'est le cas dans beaucoup de pays, les taux de mortalité infantile obtenus en rapportant le nombre des décès d'enfants de moins de 1 an survenus pendant une année à celui de naissances échelonnées sur plusieurs années n'ont guère de valeur. Comme ce facteur est important, en particulier pour les naissances vivantes, qui constituent le dénominateur des taux de mortalité infantile, on a marqué d'une croix (†) les statistiques que l'on sait établies d'après la date de l'enregistrement.

Même lorsque les statistiques sont établies d'après la date de l'événement, toute lacune dans l'enregistrement des naissances et des décès d'enfants de moins de 1 an a également pour effet de fausser les taux de mortalité infantile, à moins que la proportion des faits enregistrés ne soit la même pour le numérateur et pour le dénominateur. Les symboles C ou U du code expliqué en détail à la page 65 aideront le lecteur à se faire une idée de la qualité des données.

Ce code indique dans quelle mesure l'enregistrement et la transcription des décès d'enfants de moins de 1 an sont complets. Comme on l'a noté plus haut, les différences de complétude entre les éléments constitutifs du taux de mortalité infantile, à savoir les décès d'enfants de moins de 1 an et les naissances vivantes, introduisent des erreurs par excès ou par défaut, le sens de l'erreur dépendant de celui des deux éléments (numérateur ou dénominateur) pour lequel l'enregistrement est le plus complet. Il n'a pas été tenu compte de ce facteur pour le choix du caractère typographique qui distingue ailleurs les données sujettes à caution d'avec les autres; dans tous les cas, les taux sont reproduits ici avec le même caractère que les fréquences correspondantes.

Un autre facteur qui influe sur la complétude de l'enregistrement des naissances vivantes et des décès d'enfants de moins de 1 an est la définition adoptée, à des fins statistiques, pour les événements à déclarer. La pratique consistant à n'inscrire ni dans le registre des naissances ni dans celui des décès les enfants nés vivants qui sont morts dans les 24 heures ou avant l'enregistrement de leur naissance, peut fausser les statistiques : le taux risque alors d'être entaché d'une erreur par défaut. Si les nouveau-nés qui meurent pendant les premières semaines ne sont pas enregistrés parmi les naissances vivantes, la comparabilité des taux de mortalité infantile risque aussi d'en souffrir, mais l'erreur ne peut alors être qu'une erreur par excès.

Tableau 13

Le tableau 13 donne les taux annuels de mortalité infantile pour chaque sexe et pour "les deux sexes" selon une classification par âge détaillée. Il a été établi à partir des données figurant dans le tableau 15 mais se rapporte à la période 1952-1960. Il a paru pour la dernière fois dans l'*Annuaire démographique* de 1957 qui présentait des taux pour 1948-1956; auparavant, les taux se rapportant à 1936-1949 avaient été publiés dans l'*Annuaire démographique* de 1951 dont le tableau 13 présentait des séries portant sur 25 ans.

On peut considérer que les taux de mortalité infantile établis selon une classification par âge détaillée prolongent les statistiques du tableau 16 concernant la mortalité pour tous les âges. L'importance des données détaillées qu'il renferme pour l'analyse de la mortalité est signalée dans le texte qui accompagne le tableau des fréquences correspondant (tableau 15).

La classification par âge est légèrement plus détaillée dans le tableau 13 que dans le tableau 15. Les subdivisions de la première année de vie sont au nombre de cinq : moins de 1 jour, 1-6 jours, 7-27 jours, 28 jours-5 mois et 6-11 mois. Il n'est tenu compte des décès d'âge inconnu que pour le calcul du taux correspondant à l'ensemble des décès de moins de 1 an.

Contrairement à la méthode utilisée pour le tableau 15, on a subdivisé en deux groupes les enfants décédés dans l'intervalle d'âge : 28 jours-11 mois. Faute de place, on n'a pas fait figurer les chiffres correspondants dans le tableau 15, mais on peut les calculer de manière approchée au moyen des taux et des chiffres des naissances vivantes correspondantes qui figurent au tableau 6. On notera également que, dans cette classification, les intervalles d'âge sont exprimés en jours et non en mois civils contrairement à la méthode suivie pour établir le tableau correspondant de l'*Annuaire démographique* de 1957. Cette façon de faire est conforme aux recommandations internationales relatives aux statistiques de la mortalité infantile[43], mais on notera que de nombreux pays n'ont pas encore adopté cette norme et continuent d'exploiter les données relatives à la mortalité infantile précoce sur la base de mois civils.

Comme dans les autres tableaux, l'âge est exprimé en jours et mois révolus et calculé en soustrayant la date de la naissance (jour, mois et année) de celle du décès (jour, mois et année). En conséquence, le groupe d'âge 5-11 mois comprend les enfants âgés de 5 à 12 mois.

Les décès de sexe inconnu étant compris dans le numérateur des taux concernant "les deux sexes", ces taux, qui figurent dans la première colonne du tableau 13, devraient concorder avec les taux de mortalité infantile classiques publiés dans le tableau 12. Les divergences sont indiquées en note, quelle que soit leur importance.

Portée : 115 pays et territoires figurent dans le tableau 13. On a calculé un taux dans tous les cas où le nombre total des décès pour les deux sexes était d'au moins 50. Toutes les données qui répondaient à cette condition ont été retenues, que leur portée fût nationale ou limitée à des subdivisions géographiques ou ethniques.

Calcul des taux : Les taux représentent le nombre de décès de moins de 1 an survenus pendant l'année parmi les enfants d'âge et de sexe indiqués pour 1 000 naissances vivantes du même sexe au cours de la même période. Ainsi la base du taux pour chaque groupe défini par l'âge et le sexe est la même que celle du taux pour les décès du même sexe à tous âges; il n'a pas été fait d'ajustement pour tenir

[43] Règlement n° 1 de l'Organisation mondiale de la santé, article 8; Organisation des Nations Unies : *Principes directeurs d'un système de statistiques de l'état civil, op. cit.*, Principe 410 e) 15).

compte des décès d'enfants qui étaient nés non pendant l'année considérée mais pendant l'année précédente. Les naissances vivantes prises comme dénominateur des taux pour les deux sexes sont celles du tableau 6.

Insuffisances des données : Les taux de mortalité infantile présentés selon une classification par âge détaillée sont évidemment sujets à toutes les réserves formulées à propos des statistiques de l'état civil (voir page 64), mais leur défaut le plus important est peut-être celui qui résulte de l'exploitation des naissances vivantes d'après la date de l'enregistrement et non la date de l'événement. Les conséquences de cette pratique ont été indiquées plus haut à propos des tableaux 6 et 12, auxquels il convient de se reporter.

Comme le montre le code de qualité qui accompagne les tableaux 6 et 12, les lacunes de l'enregistrement des naissances et des décès compromettent également la comparabilité des données, le sens de l'erreur systématique variant selon que l'enregistrement est plus complet pour l'une ou l'autre des composantes des taux.

Les différences existant entre les définitions adoptées à des fins statistiques pour la naissance vivante et la mortinaissance ont été étudiées à la page 68. Les données relatives à la Guadeloupe et à la Martinique pourraient servir à évaluer l'effet de ces différences.

La méthode employée pour calculer l'âge de l'enfant au décès, arrondi au jour le plus proche, abstraction faite des heures, et non exprimé comme le temps écoulé entre la date de la naissance et celle du décès (en minutes, heures et jours de façon appropriée) peut aussi compromettre la comparabilité des données. Ce facteur fausse tout particulièrement les résultats lorsqu'il s'agit du nombre des décès survenus à moins de 1 jour et dans l'intervalle d'âge suivant; il faut en tenir compte dans l'analyse des taux, notamment pour ces groupes d'âge.

Lorsque les données relatives aux décès de moins de 4 semaines ne sont pas exploitées sur la base de l'âge en jours révolus, il existe une nouvelle cause de non-comparabilité internationale. Les décès de "moins de 1 mois" sont généralement ceux qui se produisent au cours d'un mois civil; les taux calculés sur la base de ces données ne sont pas strictement comparables à ceux qui sont établis à partir des données concernant les décès survenus pendant 4 semaines ou 27 jours révolus. Le tableau 13 montre que la classification des âges présente bien d'autres différences. C'est ainsi que, pour la mortalité néonatale précoce, la limite supérieure est parfois de 5, 10 ou 14 jours, au lieu de 7 jours, et que la frontière entre la mortalité infantile intermédiaire et la mortalité infantile tardive, est quelquefois fixée à 6 mois révolus au lieu de 5. Les conséquences de ces divergences sont difficiles à évaluer, mais il faut en tenir compte dans l'utilisation des taux.

Tableau 14

Le tableau 14 présente des données nouvelles et revisées sur l'évolution de la mortalité pour les années 1952 à 1961, ainsi que des taux bruts moyens de mortalité pour les périodes quinaires comprises entre 1945 et 1959 et pour chaque année de 1952 à 1961. Pour la première fois, on a accru la portée chronologique des séries de l'*Annuaire démographique* de manière à lui intégrer les données qui pourraient être disponibles pour l'année à laquelle se rapporte le présent volume (1961).

Presque toutes ces données reposent sur l'enregistrement des décès par les services de l'état civil. Toutefois, dans un certain nombre de cas où l'on sait qu'il n'existe pas de données d'enregistrement ou que ces données sont discutables, on a publié des taux estimatifs qui représentent sans doute plus fidèlement le niveau réel de la mortalité. Ces taux officiels concernant des années particulières ont été établis à partir de résultats de sondages, par l'analyse des données de recensements consécutifs et par inférence. Pour distinguer ces données de celles qui proviennent de registres de l'état civil, on a indiqué la méthode suivie et on a précisé leur nature dans des notes qui contiennent également, chaque fois que cela se peut, le taux correspondant établi sur la base des données d'enregistrement.

Conformément à la pratique habituelle, les lettres et signes conventionnels (C, U ou . . .), qui figurent dans la première colonne du tableau, indiquent la qualité des données; leur signification est expliquée à la page 65. Pour les pays qui ont communiqué des évaluations précises, des notes de bas de page signalent en outre le degré de complétude d'enregistrement exprimé en pourcentage.

Les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. Voir explications à la page 65.

Portée : Le tableau 14 indique le nombre des décès et les taux de mortalité pour 210 unités géographiques. Tous les pays et territoires importants figurent dans ce tableau, même si les données qui s'y rapportent ne sont pas récentes; les données se rapportant à des fractions de la population, par exemple à la population non indigène ou à la population d'une grande ville, ont été retenues lorsqu'on ne disposait pas de statistiques pour l'ensemble du pays. Ces données ne sont pas très représentatives, mais elles indiquent du moins quels sont les pays et territoires où il existe des statistiques de la mortalité.

Calcul des taux : Les taux bruts annuels qui figurent dans le tableau 14 représentent le nombre des décès signalés pendant l'année civile pour 1 000 personnes présentes au milieu de l'année. Les taux quinquennaux moyens sont établis en considérant le nombre total des décès survenus pendant une période de 5 ans et calculés pour 1 000 habitants pendant la même période. En général, les chiffres de population qui ont servi de base pour le calcul des taux sont ceux du tableau 4.

On s'est efforcé d'assurer une correspondance rigoureuse entre le numérateur (décès) et le dénominateur (population) des taux; on a signalé par des notes les cas où cette correspondance n'a pas pu être établie.

Insuffisances des données : On a fourni ailleurs des indications sur les insuffisances que traduit le code de qualité et sur la classification des statistiques en données sûres et données discutables établie sur la base de ce code. Bien que le fait ait surtout de l'importance en ce qui concerne les naissances vivantes, on a distingué les pays selon que les statistiques y sont établies d'après la date de l'événement ou d'après celle de l'enregistrement; ceux où les données sont exploitées selon la date de l'enregistrement sont indiqués par une croix (†). Les conséquences de ce mode d'exploitation sont exposées à la page 66.

Les possibilités d'erreurs dues à l'exclusion des décès d'enfants survenus avant l'enregistrement de la naissance ne sauraient non plus être négligées. On pourra les ap-

précier en examinant les données pour la Guadeloupe et la Martinique.

En plus de ces causes de variations, dont les effets ne sont pas très graves, il convient de souligner que les taux bruts ne tiennent nullement compte des différences de structure par âge et par sexe; comme la mortalité est plus forte aux premiers âges et aux âges avancés, on ne peut donc pas dire qu'ils soient strictement comparables d'une population à l'autre, ou d'une période à l'autre pour la même population, et la prudence s'impose dans toutes les comparaisons entre pays.

Tableau 15

Le tableau 15 indique la répartition des décès selon l'âge et le sexe pour chaque année de 1955 à 1960. Les séries de ce tableau, avec celles qui figurent dans l'*Annuaire démographique* de 1957 pour la période de 1948-1956 et celles qui sont présentées dans l'*Annuaire démographique* de 1951 pour la période de 1936-1947 permettent de suivre l'évolution de la mortalité selon l'âge et le sexe sur une période de 25 ans dans un certain nombre de pays.

La classification par âge utilisée ici constitue une innovation. En général, les statistiques de la mortalité infantile n'avaient été publiées selon la classification par âge détaillée que dans l'*Annuaire démographique* spécialement consacré à la mortalité, et ensuite dans un tableau spécial, distinct du tableau général sur la mortalité selon l'âge et le sexe. A partir de la présente édition, le tableau général donne la répartition de la mortalité infantile selon la classification par âge détaillée (en jours). En d'autres termes, les décès de moins de 1 an sont répartis en quatre groupes d'âge, à savoir : moins de 1 jour, 1-6 jours, 7-27 jours et 28-364 jours; les décès d'enfants d'âge inconnu ne figurent pas dans le total partiel concernant les décès de moins de 1 an bien que l'on ait quelques raisons de penser qu'il s'agit surtout de décès de moins de 1 jour. Le reste de la classification comprend les groupes suivants : 1-4 ans, groupes quinquennaux jusqu'à 84 ans, un groupe résiduel de 85 ans et plus et un groupe d'âge inconnu. Ces deux éléments de classification sont conformes aux recommandations internationales[44]. Lorsqu'elle a défini la mortalité infantile aux fins de la classification des causes de décès et de l'établissement des statistiques spéciales de la mortalité infantile, l'Organisation mondiale de la santé a recommandé, en ce qui concerne les enfants de moins de 1 an, l'adoption d'une classification par âge reposant sur le mois lunaire de 28 jours[45].

Sauf indication contraire, on suppose que l'âge est exprimé en unités de temps révolues, c'est-à-dire que l'âge de l'enfant à son décès est calculé en minutes, heures, ou jours révolus depuis sa naissance et que l'âge des personnes décédées après un an ou plus est établi en retranchant la date de la naissance (jour, mois et année) de celle du décès (jour, mois et année).

Les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. Voir explications à la page 65.

Portée : Les données présentées se rapportent à 158 unités géographiques. La nomenclature du tableau comprend tous les pays et territoires quel que soit le nombre des décès qu'ils ont signalé, mais certaines des données sont de portée (géographique ou ethnique) restreinte. Le tableau permet donc de voir quels sont les pays où les statistiques des décès sont exploitées selon l'âge et le sexe et si le classement par âge adopté est celui qu'a recommandé l'Organisation des Nations Unies.

Insuffisances des données : Les données du tableau 15 appellent les réserves indiquées par le code de complétude que l'on a décrit à propos des statistiques de l'état civil en général (page 65) et qui figure dans le tableau 14. La comparabilité des données peut aussi être influencée dans une certaine mesure par des différences de méthode d'exploitation. Une croix (†) désigne les pays où les données sont exploitées selon la date de l'enregistrement, au lieu de la date de l'événement.

Dans quelques séries, l'exclusion des décès d'enfants qui sont morts avant l'enregistrement de leur naissance et qui, de ce fait, ont été seulement comptés comme mort-nés ou "présentés sans vie" peut également contribuer au défaut de comparabilité, tant pour ce qui est du total des décès que pour les décès d'enfants de moins de 1 an, de 1 semaine ou de 1 jour. Lorsque l'on sait que ce facteur a joué, on l'a signalé en note au bas du tableau. On pourra juger de ses effets en examinant les données pour la Guadeloupe et la Martinique qui figurent dans les tableaux 12 et 14.

Comme ces données sont classées par âge, elles sont plus ou moins faussées par les inexactitudes de déclaration d'âge dont il a été question à propos de l'état de la population (voir page 62). Dans le cas des statistiques de l'état civil, les facteurs qui interviennent à cet égard sont parfois un peu différents, étant donné que le recensement et l'enregistrement des décès se font par des méthodes différentes, mais, d'une manière générale, les erreurs observées sont les mêmes.

Comme dans les tableaux de population, l'absence de chiffre pour le groupe d'âge inconnu ne signifie pas nécessairement que les déclarations d'âge sont complètes; elle peut indiquer aussi qu'on a éliminé les personnes d'âge inconnu, soit en leur attribuant un âge avant l'exploitation, soit en les répartissant proportionnellement entre tous les groupes d'âge après cette opération.

La comparabilité des données relatives à la mortalité néonatale est influencée par un facteur spécial : l'hétérogénéité de la classification par âge utilisée pour les enfants de moins de 1 an. Les notes figurant au bas du tableau prouvent que, dans de nombreux pays, on continue d'utiliser le mois civil au lieu du mois lunaire (4 semaines ou 28 jours). Les conséquences de ce mode de classification n'apparaissent pas au tableau 15, mais on peut s'en faire une idée en consultant le tableau 12 de l'*Annuaire démographique* de 1957, où les données de la mortalité infantile pour l'Autriche, la Finlande et la Norvège ont été exploitées à la fois par mois civil et par mois lunaire.

Un autre facteur nuit à la comparabilité des données, il s'agit du manque d'uniformité des méthodes suivies pour calculer l'âge au moment du décès. Bien que celles-ci influencent dans une certaine mesure les données relatives à la mortalité générale, elles ont des répercussions particulièrement profondes sur les statistiques des décès de moins de 1 jour et même de moins de 1 semaine. Comme on l'a déjà dit, l'âge d'un enfant de moins de 1 an à son décès est calculé, selon la méthode classique, en évaluant la

[44] *Principes directeurs d'un système de statistiques de l'état civil, op. cit.*, Principe 410 e) et 15).
[45] Organisation mondiale de la santé. Règlement n° 1, article 8.

durée de la vie en minutes, heures et jours, de façon appropriée. L'âge est donc exprimé en unités de temps révolues. Toutefois dans certains pays, l'âge de ces enfants n'est calculé qu'en jours, c'est-à-dire que l'âge au décès est calculé en retranchant la date de la naissance (jour, mois et année) et celle du décès (jour, mois et année). Il en résulte que de nombreux décès survenus dans les 24 heures qui suivent la naissance sont classés comme décès de 1 jour. Dans ces conditions, les données concernant les décès de moins de 1 jour sont entachées d'une erreur par défaut et celles qui se rapportent aux décès du groupe suivant d'une erreur par excès.

Les méthodes de calcul et d'enregistrement de l'âge au décès présentent le même manque d'uniformité lorsqu'elles sont appliquées à la mortalité générale; certains pays utilisent la méthode recommandée, c'est-à-dire qu'ils expriment l'âge en années révolues en retranchant la date exacte de la naissance (jour, mois et année) de celle du décès (jour, mois et année), tandis que d'autres se bornent à ne prendre en considération que la date de la naissance et celle du décès, ce qui a pour effet d'entacher d'une erreur par excès les données relatives à chaque groupe d'âge et d'une erreur par défaut celles qui concernent le groupe d'âge précédent, mais il est probable que ces erreurs se compensent sauf pour le premier et le dernier groupe d'âge.

Tableau 16

Les taux de mortalité par âge et par sexe sont publiés dans le tableau 16. Dans l'ensemble, ils partent de l'année 1952, de sorte qu'ils se raccordent aux séries antérieurement parues dans les *Annuaires démographiques* de 1951 et de 1957.

La classification par âge utilisée est la même que celle qui a servi à établir les séries publiées antérieurement; elle est ainsi constituée : le premier groupe d'âge, celui de moins de 1 an est suivi du groupe de 1-4 ans, puis viennent des groupes quinquennaux jusqu'à 84 ans et enfin un groupe d'âge de 85 ans et plus. Des traits horizontaux s'étendant sur plus d'une colonne indiquent les cas où l'on s'est écarté de cette classification. Il convient de souligner que cette classification n'est pas absolument analogue à celle qui a été utilisée pour le tableau 15, car les taux de mortalité infantile selon la classification par âge détaillée sont présentés dans un autre tableau, à savoir le tableau 13. En conséquence, le tableau 16 ne repose que sur la classification par âge ordinaire où les décès de moins de 1 an sont bloqués en un seul groupe.

Etant donné que les taux de ce tableau sont calculés sur la base des statistiques du tableau 15, les données utilisées représentent l'âge en années révolues, c'est-à-dire qu'elles ont été obtenues en faisant la différence entre jour, mois et année du décès et jour, mois et année de la naissance.

Les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. Voir explications à la page 65.

Portée : Bien qu'il ait été nécessaire de disposer d'une base acceptable, c'est-à-dire de données sur la population qui correspondent à la répartition des décès par âge et par sexe, il a été possible de présenter dans ce tableau des taux spécifiques pour 90 pays et territoires. "Acceptable" signifie en l'occurrence que les chiffres de population et de décès devaient se rapporter au même territoire et aux mêmes groupes de la population et être les uns et les autres répartis selon les mêmes intervalles d'âge. De plus, la répartition par âge devait résulter d'un recensement ou se fonder sur un dénombrement corrigé à l'aide des statistiques de l'état civil et des migrations. Les estimations établies par la méthode des prorata en multipliant le chiffre total par les pourcentages correspondant à chaque groupe d'âge au moment du recensement n'ont pas été utilisées pour le calcul des taux.

Calcul des taux : Chaque taux représente le nombre de décès survenus dans un groupe d'âge et de sexe déterminé au cours d'une année, pour 1 000 personnes appartenant à ce groupe au milieu ou à quelque autre époque de l'année. Les chiffres de population employés sont ceux du tableau 5 ou du tableau correspondant de l'*Annuaire démographique* de 1960 concernant l'évolution de la population selon l'âge et le sexe. On n'a pas tenu compte des décès survenus à un âge inconnu ni de la population d'âge inconnu, sauf en ce qui concerne le taux de mortalité pour tous les âges combinés.

Il y a lieu de noter que, dans ce tableau, les taux relatifs au groupe de moins de 1 an sont différents des taux de mortalité infantile des tableaux 12, 13 et 19, qui sont établis d'après le nombre de naissances vivantes et non sur la base de 1 000 habitants.

De même, les taux donnés pour tous les âges combinés diffèrent dans plusieurs cas de ceux qui figurent dans d'autres tableaux parce qu'ils se rapportent à une population pour laquelle on disposait d'une répartition par âge appropriée tandis que les taux des tableaux en question peuvent avoir été calculés sur la base d'un total différent. Ainsi, il est possible que les chiffres de population par âge et par sexe proviennent d'un recensement effectué dans l'année et non au milieu de l'année; il arrive également qu'ils ne comprennent pas les mêmes groupes ethniques, les mêmes catégories de militaires, etc. Quelquefois, la différence tient à ce que les taux du tableau 16 ont été calculés sur la base de la population moyenne (obtenue en faisant la moyenne des données par âge au mois de décembre de deux années consécutives) alors que les taux correspondants du tableau 14 reposent sur une estimation au 1er juillet. Les écarts de cet ordre sont insignifiants mais, à toutes fins utiles, on les a signalés dans le tableau.

Insuffisances des données : Les taux du tableau 16 sont calculés à partir des fréquences du tableau 15 et, partant, toutes les réserves mentionnées à propos de ce tableau leur sont applicables.

Lorsqu'il s'agit de taux de mortalité par âge, il est particulièrement difficile d'établir une correspondance exacte entre les décès et la population en ce qui concerne l'inclusion ou l'exclusion des forces armées, des réfugiés, des personnes déplacées et d'autres groupes spéciaux. Dans les cas où il n'a pas été possible d'y parvenir tout à fait, des notes indiquent les différences de portée des données de base. Les taux de mortalité pour le sexe masculin dans les groupes d'âge de 20 à 40 ans sont tout particulièrement faussés par ce manque de correspondance et il importe d'être prudent lorsqu'on les utilise dans des comparaisons.

Il convient d'ajouter que, même lorsque population et décès correspondent, la comparabilité des taux peut être compromise par des conditions anormales telles que l'absence du territoire d'un grand nombre de jeunes hommes sous les drapeaux. Il arrive ainsi que les taux de mortalité

paraissent élevés aux âges les moins avancés simplement parce qu'on a laissé de côté un grand nombre d'hommes valides de ces groupes d'âge pour lesquels le taux de mortalité pourrait être, dans des conditions normales, inférieur à la moyenne observée pour les personnes du même âge.

Tableau 17

Le tableau 17 présente des statistiques des causes de décès (nombres absolus et taux) pour chaque année de la période 1955-1960, et indique dans quelle mesure les décès de chaque rubrique ont été médicalement certifiés. Ce tableau groupe les données antérieurement publiées dans deux tableaux distincts et, avec le tableau 14 de l'*Annuaire démographique* de 1957 et les tableaux correspondants des *Annuaires démographiques* de 1951 et 1952, permet d'établir une série commençant en 1947, moyennant certains ajustements destinés à tenir compte des modifications apportées au système de classification utilisé[46].

Une cause de décès est *un état morbide ou un processus pathologique, une anomalie, un traumatisme ou un empoisonnement ayant provoqué, directement ou indirectement, la mort*[47]. Les causes immédiate et initiale de décès sont mentionnées dans le certificat médical de décès mais la *cause initiale* est celle qui doit être prise en considération pour l'établissement des statistiques de la mortalité. Elle peut être définie comme : a) *la maladie ou le traumatisme ayant provoqué l'enchaînement des phénomènes morbides qui ont abouti directement à la mort, ou* b) *les circonstances de l'accident ou du traumatisme qui ont entraîné la mort*[48].

La classification des causes de décès utilisée est la Liste abrégée de 50 rubriques pour la mise en tableaux des causes de mortalité figurant dans la sixième revision (1948) de la Nomenclature internationale des causes de décès[49]. Aucune série établie d'après les revisions précédentes de la Nomenclature n'est présentée ici; pour les séries établies d'après la revision de 1955, on a fourni en note les indications nécessaires. Il est à noter que le titre complet de chacune des 50 rubriques et les numéros de la Liste détaillée sont indiqués au début du tableau (page 398) pour la nomenclature en anglais et à la fin du tableau (page 471) pour la nomenclature en français. Si l'on a adopté cette solution, c'est pour ne pas être obligé, faute de place, de diminuer considérablement la portée chronologique des séries.

Les décès médicalement certifiés sont ceux qui sont enregistrés comme ayant été mentionnés ou certifiés par l'agent médical qui témoigne de l'événement. Les décès pour lesquels le type de certification n'est pas connu sont réputés ne pas avoir été certifiés par un agent médical, mais par une personne n'appartenant pas à la profession médicale; en conséquence ils ont été exclus des statistiques du tableau 17.

Les pourcentages des décès médicalement certifiés sont indiqués chaque fois qu'ils sont inférieurs à 100 pour cent. Lorsque l'on sait que tous les décès ont été médicalement certifiés, on l'a indiqué par une note spéciale de bas de page.

Les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. Voir explications à la page 65.

Portée : 118 pays et territoires sont représentés dans ce tableau. Le critère utilisé pour déterminer s'il convenait d'inclure des données relatives à tel ou tel pays ou territoire était l'existence de données classées selon la Liste abrégée mentionnée plus haut. Certaines statistiques dont on savait qu'elles étaient inexactes parce que des certificats de décès n'avaient pas été établis par des médecins, ont néanmoins été retenues dans la mesure où elles répondaient à la condition précitée. En effet, il était impossible de savoir où tirer la ligne de démarcation entre données "exactes", et "inexactes" et une répartition par cause, si défectueux que soient les diagnostics sur lesquels elle repose, fournit quand même des indications sur l'importance relative des diverses causes envisagées. Il est à noter toutefois que des taux ont été calculés uniquement pour certaines de ces répartitions (voir ci-après ce qui a trait au calcul des taux).

Calcul des taux : Les taux de mortalité par cause sont exprimés pour 100 000 personnes sur la base de la population totale estimée au milieu de l'année ou à un autre moment de l'année. En conséquence, le taux pour toutes les causes combinées est la somme des taux relatifs à chacune d'elles et représente 100 fois le taux brut de mortalité des tableaux 14 et 16. Les chiffres de population utilisés pour le calcul des taux sont ceux du tableau 4.

Il n'a été calculé de taux que pour les répartitions comportant un total de 1 000 décès ou plus imputables à toutes les causes et pas plus de 25 pour cent de décès dus à la sénilité ou à des causes mal définies ou inconnues (B45). Si on n'a calculé les taux que pour les répartitions comptant 1 000 décès ou plus, c'est par suite du manque de fiabilité des taux établis sur la base de chiffres peu élevés. Le deuxième critère repose sur l'hypothèse selon laquelle, si 25 pour cent des décès sont classés comme dus à la sénilité ou à des causes mal définies ou inconnues, les chiffres relatifs aux 49 autres causes de la Nomenclature doivent comporter une sérieuse erreur par défaut. La limite a été fixée délibérément à un niveau élevé; il serait peut-être préférable qu'elle soit placée à 10 pour 100 pour éliminer toutes les données défectueuses. D'ailleurs, il faut reconnaître que ce critère ne tient pas compte des pourcentages de la catégorie B46, qui sont également significatifs, cette catégorie résiduelle, réunissant souvent une proportion anormalement forte de l'ensemble des décès.

Dans un ou deux cas, on remarquera que le taux pour toutes les causes combinées ne concorde pas exactement avec le taux de mortalité générale correspondant des tableaux 14 ou 16. Cette disparité est due essentiellement à des différences concernant le nombre total de décès classés selon la cause. Ces différences peuvent venir de ce qu'on a omis d'exploiter, d'après la cause, certaines déclarations tardives, ou exclu, dans la répartition des décès selon la cause, les enfants nés vivants décédés pendant les pre-

mières 24 heures ou avant l'enregistrement de leur naissance et, partant, enregistré avec les mort-nés. Dans plusieurs pays, les méthodes d'exploitation permettent de différencier ces pseudo-mort-nés des mort-nés véritables et de les ajouter au nombre total de décès, mais, là encore, il est impossible de connaître la cause du décès puisqu'elle n'est pas enregistrée.

Le taux de certification médicale représente pour chaque rubrique le nombre de décès médicalement certifiés pour 100 décès attribués à la même cause. Il permet de calculer, par différence, le pourcentage des décès certifiés par des personnes n'appartenant pas à la profession médicale, encore que le chiffre ainsi retenu puisse comprendre des décès pour lesquels on ignore la nature de la certification.

Insuffisances des données : Les statistiques des causes de décès, qui sont de la plus grande importance pour la santé publique et les études démographiques, présentent malheureusement de nombreuses imperfections, outre celles qu'on a déjà mentionnées comme limitant la comparabilité internationale des statistiques de l'état civil en général et des décès en particulier. Ces imperfections supplémentaires sont liées principalement aux différences existant entre les pays du point de vue de la qualité, du degré de développement et de l'efficacité des services médicaux ainsi que des méthodes d'établissement des certificats de décès et des procédés de codification.

Dans la plupart des pays, lorsqu'un décès est enregistré aux fins de la statistique, le bulletin qui est établi doit mentionner la cause du décès. Or, la déclaration de la cause peut émaner de plusieurs sources : 1) si le décès a été suivi d'une autopsie, il est probable qu'on en aura décelé la cause "véritable"; 2) s'il n'y a pas eu d'autopsie, mais si le décédé a reçu, avant sa mort, les soins d'un médecin, la déclaration de la cause du décès reflètera l'opinion de ce médecin, laquelle sera fondée sur l'observation du malade alors qu'il vivait encore; 3) si, au contraire, le malade est mort sans avoir reçu de soins médicaux, il se peut qu'un médecin examine le corps (sans qu'il soit fait d'autopsie), auquel cas il pourra, en questionnant les personnes qui ont vu le malade avant sa mort, se former une opinion sur la cause probable du décès; 4) il se peut encore que, sans voir le corps, un médecin ou une autre personne de formation médicale interroge des témoins et arrive ainsi à un diagnostic; 5) enfin, il y a le cas où de simples témoins indiquent une cause de décès sans l'avis d'un médecin.

A ces cinq sources de renseignements possibles sur la cause d'un décès correspondent en général cinq degrés d'exactitude des données. Cependant, les chiffres du tableau 17 ne se rangent exactement dans aucun de ces cas. Dans certains pays[50], l'expression "certification médicale" signifie "certificat signé par un médecin"; elle peut donc s'appliquer aux quatre premières possibilités mentionnées plus haut. Dans d'autres pays, elle sous-entend que le malade a "reçu les soins d'un médecin avant sa mort". Il est donc bien évident qu'il faut être prudent lorsqu'on veut faire des comparaisons de pourcentages entre pays. Néanmoins, malgré les réserves qu'ils appellent, ces pourcentages fournissent un indice de plus de la qualité des statistiques des causes de décès. Ils donnent aussi une idée des causes qui retiennent l'attention du corps médical.

La comparabilité est aussi parfois très difficile à assurer par suite des différences existant dans la forme des certificats de décès utilisés, de la tendance à indiquer plus d'une cause de décès sur le certificat et de la diversité des principes régissant le choix de la cause principale ou initiale à retenir dans les statistiques quand le certificat indique plus d'une cause[51].

Les différences existant entre les termes utilisés pour désigner la même maladie compromettent aussi la comparabilité des statistiques. On en recontre parfois d'une région à l'autre d'un même pays, où les gens parlent tous la même langue, mais elles sont particulièrement embarrassantes quand plusieurs langues interviennent. Ces différences soulèvent des difficultés même quand les décès sont certifiés par un médecin, mais elles sont infiniment plus grandes et plus difficiles à éclaircir lorsque la cause du décès est indiquée par de simples témoins. Les Centres de l'Organisation mondiale de la santé pour le classement des maladies — notamment le Centre de l'Amérique latine, situé à Caracas (Venezuela) — s'employent à étudier et à résoudre ce problème de terminologie.

En outre, des problèmes de codification, c'est-à-dire des problèmes d'interprétation des règles, se posent constamment dans l'intervalle entre deux revisions du Classement statistique international des maladies, traumatismes et causes de décès. Les pays n'interprètent pas ces règles de manière uniforme et ne les adaptent pas de la même façon à leurs besoins; la comparabilité s'en ressent, comme le montrent les statistiques. Cela est particulièrement vrai pour les causes comme la pneumonie et les maladies diarrhéiques et autres, qui sont codifiées différemment selon l'âge du défunt. Les changements d'interprétation et l'adoption de nouvelles règles peuvent aussi introduire des divergences dans les séries chronologiques d'un même pays. En conséquence, il convient d'examiner attentivement les cas où le nombre des décès attribués à des maladies déterminées s'accroît ou diminue sensiblement pour s'assurer, avant de conclure à une évolution de la mortalité, que le changement n'est pas dû à la méthode de codification.

Exception faite des divergences cachées résultant des facteurs mentionnés ci-dessus, les diverses rubriques de la Liste abrégée devraient en principe être comparables. Toutefois, il convient de signaler ici une anomalie qui se retrouve dans plusieurs répartitions — en particulier pour les pays d'Asie et de la région des Caraïbes — en ce qui concerne les morts accidentelles et violentes. Dans ces répartitions, certains décès qui doivent normalement rentrer dans les catégories BE47-BE50 du classement selon la cause (code E) y sont bien rangés, mais d'autres décès analogues sont classés *uniquement* d'après la nature du traumatisme (code N). Ainsi, ces décès ne peuvent être exactement répartis entre les quatre catégories "BE" et sont par conséquent indiqués comme un seul groupe.

Toutes les autres divergences connues sont signalées en note. Toutefois, pour interpréter les répartitions comportant un nombre relativement élevé de décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45), il faut procéder avec beaucoup de prudence. Il convient aussi d'examiner de très près le groupe toutes autres maladies (B46). Si les chiffres donnés pour ces deux catégories B45 et B46 sont importants, c'est sans doute parce que les décès survenus dans des groupes en-

[50] Salvador, Uruguay, Mexique.

[51] Comparabilité des statistiques des causes de décès . . . , *op. cit.*

tiers de la population n'ont fait l'objet d'aucun diagnostic et il est probable qu'en pareils cas la répartition des causes connues sera loin de donner une vue exacte de la situation d'ensemble. Cet examen critique des répartitions, ainsi que l'utilisation du code général de qualité présenté dans le tableau 14 et des renseignements sur la certification médicale devraient permettre de se faire une idée approximative de la valeur des statistiques des causes de décès. Pour une étude plus approfondie des progrès réalisés dans l'établissement des statistiques des causes de décès et des problèmes qui se posent, voir le chapitre II de l'*Annuaire démographique* de 1951.

Tableau 18

Le tableau 18, qui paraît pour la première fois depuis 1957, présente des données sur les décès selon la cause et l'âge pour chacun des deux sexes. Faute de place, les chiffres reproduits se rapportent à une seule année (la dernière pour laquelle on possède des statistiques); il s'agit le plus souvent de 1959 ou de 1960. Ces chiffres, avec ceux de l'*Annuaire démographique* de 1951 pour les années antérieures à 1950 et ceux de l'*Annuaire démographique* de 1957 pour 1955 ou 1956, permettent d'établir des comparaisons dans le temps, mais il ne faut pas oublier qu'il peut y avoir une solution de continuité entre les Revisions de 1938 et de 1948 de la Nomenclature (voir p. 87).

Une cause de décès est *un état morbide ou un processus pathologique, une anomalie, un traumatisme ou un empoisonnement ayant provoqué, directement ou indirectement, la mort*[52]. Les causes immédiates et initiales de décès sont mentionnées dans le certificat médical de décès mais la *cause initiale* est celle qui doit être prise en considération pour l'établissement des statistiques de la mortalité. Elle peut être définie comme : a) *la maladie ou le traumatisme ayant provoqué l'enchaînement des phénomènes morbides qui ont abouti directement à la mort, ou* b) *les circonstances de l'accident ou du traumatisme qui ont entraîné la mort*[53].

Les données représentent l'âge au dernier anniversaire, ou en années révolues, selon la définition utilisée pour les autres tableaux où figure cette caractéristique.

La classification des causes de décès est la même que dans le tableau 17; elle correspond à la Liste abrégée de 50 rubriques pour la mise en tableaux des causes de mortalité du Classement statistique international des maladies, traumatismes et causes de décès — sixième revision, ou revision de 1948, des Nomenclatures internationales[54]. On notera que, dans ce tableau, la colonne des causes de décès ne reprend que les *numéros des rubriques de la Liste abrégée : B1 à BE50;* pour les désignations complètes et les numéros de la Nomenclature détaillée correspondant à chacune des rubriques, voir le tableau 17, page 398 pour le texte anglais et page 471 pour le texte français.

Les données sont réparties entre 8 groupes d'âge : moins de 1 an, 1-4 ans, 5-14, 15-24, 25-44, 45-64, 65 ans et plus et "inconnu". Cette répartition est moins détaillée qui ne le voudraient les diverses recommandations internationales en la matière[55], mais les groupes choisis correspondent aux principales étapes de la vie humaine, de la première enfance à la vieillesse, et aux périodes où les diverses maladies ont généralement la plus forte incidence.

Portée : Le tableau 18 indique une répartition des décès selon la cause, l'âge et le sexe pour 55 pays et territoires, soit un peu moins qu'il aurait été possible d'en retenir si l'on n'y avait pas mis certaines conditions. La première était que le nombre total des décès pour les deux sexes fût d'au moins 1 000; la deuxième que les décès fussent classés par cause, selon la revision de 1948 ou de 1955 de la Nomenclature internationale et les tableaux conformes à la Liste abrégée de 50 rubriques pour la mise en tableaux des causes de mortalité ou à une liste qui lui corresponde directement, par exemple la Liste intermédiaire; la troisième enfin que le total des décès classés sous la rubrique *B45 ("Sénilité sans mention de psychose, et causes mal définies ou inconnues")* n'atteignît pas 25 pour 100 de l'ensemble des décès pour l'un des deux sexes au moins.

Insuffisances des données : Les données du tableau 18 présentent toutes des imperfections propres aux statistiques des décès en général, auxquelles viennent s'ajouter celles qui sont dues aux erreurs dans les déclarations d'âge et dans la certification et la classification des causes de décès. Etant donné que toutes ces imperfections ont déjà été exposées à propos d'autres tableaux, on n'y reviendra pas ici. Pour les problèmes relatifs aux déclarations d'âge et les difficultés concernant les déclarations et la classification des causes de décès, on se reportera à la description des tableaux 15 et 17 respectivement. On peut se rendre compte de l'exactitude générale de ces statistiques selon les causes de décès en examinant le pourcentage des décès, médicalement certifiés, qui sont attribuables à chacune des causes (voir tableau 17).

On s'est efforcé d'étudier de très près les données douteuses concernant les causes et l'âge comme par exemple les chiffres des décès résultant de suicides (BE49) ou d'homicides (BE50) survenues parmi les enfants de moins de 1 an ou les jeunes enfants; lorsqu'on a conservé ces données, on a indiqué qu'elles étaient probablement dues à un codage imparfait. Par contre, les décès déclarés comme étant attribuables à des complications de la grossesse (B40) — et qui normalement ne devraient se produire que parmi les femmes en âge de procréer — n'ont pas fait l'objet d'un renvoi en note lorsqu'ils sont survenus à des âges ultérieurs, car dans certains pays les méthodes de codage permettent de retenir cette cause de décès au-delà de la période de procréation.

Tableau 19

Le tableau 19 indique ce que sont les taux de mortalité selon la cause, l'âge et le sexe pour la dernière année sur laquelle on soit renseigné. L'année retenue est celle pour laquelle on dispose d'une répartition de la population selon l'âge et le sexe correspondant à la classification des chiffres absolus des décès selon ces deux caractéristiques. Etant donné que les chiffres concernant la population de base proviennent souvent d'un recensement de population, les années auxquelles se rapportent les statistiques du tableau 19 ne sont pas toujours aussi récentes que celles sur lesquelles portent les chiffres absolus du tableau 18.

C'est la seconde fois que des taux de mortalité selon la

[52] *Principes directeurs d'un système de statistiques de l'état civil, op. cit.,* Principe 309 4).
[53] *Ibid.*
[54] *Manuel . . . , op. cit.,* p. 369.
[55] *Principes directeurs d'un système de statistiques de l'état civil, op. cit.;* Principe 410 e) 10). Voir également le Règlement n° 1 de l'Organisation mondiale de la santé, article 6.

cause, l'âge et le sexe sont publiés dans l'*Annuaire démographique,* le premier tableau consacré à ces statistiques ayant paru dans l'*Annuaire démographique* de 1957. Celui-ci donnait des taux se rapportant essentiellement à 1955 ou 1956. Le tableau 19 présente des taux concernant 1959 ou 1960 pour les pays figurant dans la Nomenclature du tableau correspondant de l'*Annuaire* de 1957, ce qui permet d'établir des comparaisons dans le temps.

La définition et la classification des causes de décès sont les mêmes que dans le tableau 18. La définition et la classification adoptées pour l'âge sont analogue à celles qui ont servi à établir le tableau 18, à ceci près que le tableau 19 ne comporte pas de groupe d'âge inconnu.

Les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. Voir explications à la page 65.

Portée : Le tableau 19 présente des taux de mortalité selon la cause, l'âge et le sexe pour 39 pays et territoires. Ce chiffre est très limité, car on ne dispose que rarement du chiffre de population auquel on doit rapporter les données classées selon les caractéristiques en question pour calculer les taux du tableau.

Calcul des taux : Pour les décès de 1 an et plus, les taux selon la cause, l'âge et le sexe sont calculés sur la base de 100 000 personnes du même âge et du même sexe; pour les enfants de moins de 1 an, ils sont établis sur la base de 100 000 naissances vivantes du même sexe survenues au cours de la même année. Il n'est pas tenu compte des décès d'âge inconnu, sauf dans le total des décès à tous les âges.

Insuffisances des données : Les taux du tableau 19 comportent toutes les imperfections inhérentes aux statistiques de la mortalité et, indirectement, celles qui sont propres aux statistiques démographiques. Les inexactitudes des déclarations d'âge sont également parmi les facteurs dont il faut tenir compte pour évaluer la comparabilité de ces données.

Lorsqu'on veut faire des comparaisons de taux de mortalité selon la cause entre pays, on risque de commettre de graves erreurs d'interprétation non seulement parce que le pourcentage des décès certifiés par un médicin varie considérablement d'un pays à l'autre (voir le tableau 17), mais encore parce que les méthodes utilisées pour déterminer la cause principale, lorsque le certificat en mentionne plusieurs, ne sont pas uniformes. La classification statistique finale de la cause retenue peut être aussi une source de variations. Tous ces facteurs, et d'autres de caractère plus général, ont été étudiés à propos des tableaux 17 et 18; ils ont fait l'objet d'un examen plus détaillé dans le chapitre II de l'*Annuaire démographique* de 1951 et dans le *Manuel de statistique de l'état civil* auxquels le lecteur pourra se reporter.

Tableau 20

Le tableau 20 indique le nombre de décès selon l'état matrimonial, l'âge et le sexe du décédé pour la dernière année sur laquelle on soit renseigné. Il donne également le nombre de décès selon l'état matrimonial et le sexe lorsque la répartition par âge n'est pas connue.

C'est la seconde fois que des statistiques de ce genre sont publiées dans l'*Annuaire démographique.* Des séries analogues ont déjà paru dans l'*Annuaire démographique* de 1958 en raison de l'intérêt qu'elles présentent pour l'étude de la dissolution du mariage; elles sont reproduites ici du fait qu'elles sont importantes pour l'analyse de la mortalité.

Dans ce tableau, le classement selon l'état matrimonial comporte sept catégories au maximum, et quatre au minimum, selon les données disponibles. Pour l'ensemble du tableau, la règle est de distinguer au moins les catégories suivantes : célibataires, mariés, veufs et divorcés; lorsque les données de base le permettent, à la catégorie des mariés s'ajoutent deux sous-groupes : unions consensuelles et séparés; le cas échéant, on a ajouté une rubrique : inconnue. Si les quatre catégories types apparaissent sans précisions particulières, on peut admettre qu'elles sont ainsi constituées : 1) célibataires : personnes qui n'ont jamais été mariées (y compris les personnes ayant bénéficié d'une annulation); 2) mariés, y compris les personnes vivant en union de fait stable (coutumière ou consensuelle) et celles qui sont en état de séparation légale ou de fait, c'est-à-dire les séparés; 3) veufs, non remariés; 4) divorcés, non remariés. On a utilisé des rubriques supplémentaires dans le talon du tableau, des notes ou des crochets pour expliquer, le cas échéant, en quoi le classement s'écarte des définitions ci-dessus.

Comme partout ailleurs dans l'*Annuaire démographique,* la classification par âge est exprimée en années révolues. Elle comprend 11 groupes, qui sont les suivants : moins de 15 ans, 15-19 ans, 20-24 ans, groupes décennaux jusqu'à 75-84 ans, 85 ans et plus et un groupe d'âge inconnu. Lorsque les données reçues ne correspondaient pas exactement à ces groupes, on a indiqué par des traits horizontaux ou en note les cas où plusieurs groupes types ont été fondus.

On remarquera que, pour le groupe moins de 15 ans, le signe non disponible (...) apparaît parfois. Cela signifie que le classement des décès selon l'état matrimonial ne tient pas compte des décès de moins de 15 ans car on suppose que ces personnes sont toutes célibataires. Toutefois, on peut constater que cette hypothèse n'est pas toujours fondée en se reportant à l'âge minimum du mariage (voir tableau 28), ainsi qu'à la répartition de la population selon l'état matrimonial (voir *Annuaire démographique* de 1958).

Les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. Voir explications à la page 65.

Portée : Le tableau 20 donne les taux de mortalité selon l'état matrimonial, l'âge et le sexe pour 37 pays et territoires; on trouvera en outre, à la fin du tableau, 16 répartitions supplémentaires où il n'est tenu compte que de l'état matrimonial et du sexe.

Insuffisances des données : Les données du tableau 20 appellent toutes les réserves indiquées à la page 85, qu'il s'agisse de leur qualité, des différences de portée ou d'autres caractéristiques. L'exclusion des décès d'enfants nés vivants qui meurent avant l'enregistrement de leur naissance n'influe que sur le total des décès et sur les décès de moins de 15 ans; en revanche, les erreurs dues aux inexactitudes de déclaration d'âge (définies à la page 62 et signalées à propos du tableau 15) peuvent fausser les données dans tous les groupes d'âge.

La comparabilité dépend également de l'exactitude des réponses à la question concernant l'état matrimonial du décédé. Il y a tout lieu de penser qu'au moment du dé-

nombrement de la population, de nombreux divorcés peuvent se déclarer soit célibataires soit mariés soit veufs, tandis que de nombreux hommes mariés qui sont séparés de leur épouse peuvent se déclarer célibataires. Il n'existe pas de données qui permettent de déterminer l'importance de ce facteur dans le cas des déclarations de décès, mais il paraît raisonnable de penser qu'il est peu probable que l'on obtienne des réponses inexactes à l'occasion des décès. En effet, les renseignements sont généralement fournis par un parent qui est bien placé pour savoir exactement quel était l'état matrimonial du décédé; en outre, les motifs qui incitent à faire une déclaration incorrecte ne jouent plus le même rôle après la mort de l'intéressé. Néanmoins, il conviendrait de garder la question présente à l'esprit au cas où l'on voudrait calculer des taux.

Les différences existant dans la composition de chaque catégorie d'état matrimonial peuvent nuire à la comparabilité des données. Un des facteurs les plus importants est le classement des décédés ayant vécu en union consensuelle. On estime que dans la plupart des cas la catégorie indiquée pour ces personnes est celles des "mariés"; c'est pourquoi l'Organisation des Nations Unies a recommandé de ranger les décédés en question parmi les mariés lorsque les décès correspondants ne font pas l'objet d'un classement spécial. On ne sait pas dans quelle mesure cette recommandation est appliquée. Il en va de même pour la catégorie des séparés : aux fins du tableau 20, les décédés qui vivaient séparés de leur conjoint au moment du décès doivent être considérés comme "mariés" mais ils sont parfois assimilés aux divorcés. Dans certains pays, on n'indique pas que l'état matrimonial du décédé est inconnu car on attribue un état matrimonial déterminé à chaque décédé avant d'exploiter les données. Dans d'autres, les chiffres des décédés dont l'état matrimonial est inconnu sont très élevés. Il faut tenir compte de ces différences éventuelles dans la composition des catégories de l'état matrimonial lorsque l'on veut comparer les statistiques.

Une autre réserve s'impose à propos des données de ce tableau. Elle a trait à l'homogénéité des différentes catégories d'état matrimonial du point de vue des antécédents matrimoniaux des individus qui les composent. A cet égard, on peut dire que seul le groupe des célibataires est homogène. En effet, les décédés classés comme mariés ont pu avoir été antérieurement divorcés ou veufs; ceux qui sont classés dans le groupe des divorcés étaient antérieurement mariés et certains d'entre eux peuvent avoir été veufs; les veufs étaient antérieurement mariés, voire déjà veufs ou divorcés. En raison de ces chevauchements, aucune des catégories, à l'exception de celle des célibataires, n'est complète du point de vue des antécédents matrimoniaux. Aucune d'entre elles ne comprend les personnes qui ont appartenu au groupe visé mais dont l'état matrimonial a changé. Il convient de tenir compte de ce facteur pour interpréter les différences entre groupes.

Tableau 21

Ce tableau, qui paraît pour la première fois dans l'*Annuaire démographique,* présente des taux de mortalité selon l'état matrimonial, l'âge et le sexe pour la dernière année sur laquelle on soit renseigné. L'année retenue est celle pour laquelle on dispose d'une répartition de la population selon l'âge et le sexe correspondant à la classification des chiffres absolus des décès selon ces deux caractéristiques. Etant donné que les chiffres concernant la population de base proviennent souvent d'un recensement de population, les années auxquelles se rapportent les statistiques du tableau 21 ne sont pas toujours aussi récentes que celles sur lesquelles portent les chiffres absolus du tableau 20.

L'état matrimonial et l'âge sont définis et classés comme dans le cas du tableau 20 à ceci près qu'il n'est pas tenu compte du groupe d'âge inconnu ni de la catégorie état matrimonial inconnu pour l'établissement du tableau 21 (voir plus bas, calcul des taux). Comme dans le tableau 20, on a parfois indiqué qu'il n'existait pas de données pour les décédés de moins de 15 ans, l'exploitation des statistiques de la mortalité selon l'état matrimonial étant limitée aux décédés de 15 ans et plus.

Les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. Voir explications à la page 65.

Portée : Le tableau 21 donne les taux de mortalité selon l'état matrimonial, l'âge et le sexe pour 20 pays et territoires; on trouvera en outre, à la fin du tableau, 19 répartitions supplémentaires où il n'est tenu compte que de l'état matrimonial et du sexe. Le nombre des pays et territoires auxquels se rapportent ces statistiques est très limité car on ne dispose que rarement du chiffre de population auquel on doit rapporter les données classées selon les caractéristiques en question pour calculer les taux du tableau.

Calcul des taux : Les taux de mortalité selon l'âge, le sexe et l'état matrimonial sont calculés sur la base de 1 000 personnes du même âge et du même sexe. Il n'est pas tenu compte de la répartition de la population des personnes d'âge et d'état matrimonial inconnus et par conséquent aucun taux n'a été calculé en ce qui les concerne.

Insuffisances des données : Etant donné que les taux de mortalité selon l'état matrimonial, l'âge et le sexe sont calculés en rapportant des données analogues à celles du tableau 20 aux chiffres de population correspondants, ils sont sujets, quant à leur comparabilité, aux mêmes limitations que les chiffres du tableau 20. Les causes de ces insuffisances touchent aux problèmes de la définition, des déclarations et de la classification de l'âge et de l'état matrimonial des décédés (voir page 90) ainsi qu'aux problèmes analogues que posent les recensements en ce qui concerne l'enregistrement et la classification de ces caractéristiques. Pour ce qui est des défauts que présentent les données de recensement, on pourra se reporter à l'*Annuaire démographique* de 1958 (pages 66-68).

Il est certain que les erreurs consécutives à l'utilisation de ces deux méthodes différentes de rassemblement des données (c'est-à-dire l'enregistrement par le service de l'état civil et le dénombrement) peuvent présenter certaines différences et que les déclarations erronées risquent d'être plus nombreuses dans le cas du recensement. S'il en est ainsi, c'est en partie parce que, lors du dénombrement, la personne interrogée n'est pas nécessairement bien placée pour connaître exactement l'âge ou l'état matrimonial de l'autre membre du ménage au sujet duquel elle est interrogée. Par exemple, l'âge déclaré à l'agent recenseur est souvent un chiffre se terminant par un zéro ou un cinq. Les divorcés et séparés risquent d'être à tort enregistrés comme célibataires au moment du dénombre-

ment, mais les personnes en unions consensuelles qui ne sont pas classées comme telles ont plus de chance d'être déclarées comme mariées au moment du dénombrement qu'au moment de l'enregistrement de leur décès où leur véritable état matrimonial sera indiqué. Pour la même raison, l'état matrimonial risque davantage d'être déclaré comme inconnu lors d'un recensement que lors de l'enregistrement du décès.

Cependant, on peut se rendre compte de la portée réelle de ces imperfections théoriques d'après les résultats d'une enquête récente menée notamment par les autorités des Etats-Unis[56] sur la comparabilité des déclarations de l'état matrimonial faites à l'occasion du recensement de la population et de l'enregistrement des décès. Selon cette étude rétrospective, c'est pour le groupe des mariés que la correspondance est la plus parfaite : 97 pour 100; le pourcentage va en diminuant pour les célibataires, les veufs et les divorcés : il s'établit respectivement à 88, 82 et 69 pour 100. Une étude britannique[57] effectuée selon une méthode très voisine de celle qui a été utilisée aux Etats-Unis, montre que pour *97 pour 100 des hommes décédés entre 35 et 64 ans, l'état matrimonial déclaré a été le même dans le cas du recensement et dans celui de l'enregistrement des décès; pour les mariés, la correspondance est de 98 pour 100; pour les célibataires de 88 pour 100; et pour les veufs et divorcés de 94 pour 100.*

En plus des différences qui tiennent essentiellement au fait que le déclarant n'est pas toujours le même, il peut exister des divergences qui sont dues au manque d'uniformité de la méthode suivie pour classer les données de recensement selon l'âge et plus spécialement l'état matrimonial. Il est par exemple évident que les données de recensement de la population distinguent plus souvent que les statistiques de la mortalité selon l'état matrimonial les personnes en union consensuelle des personnes séparées.

Enfin, lorsque l'on utilise les taux selon l'état matrimonial et l'âge pour analyser la mortalité, il faut considérer qu'à l'exception du groupe des personnes classées comme "célibataires", les autres catégories ne constituent pas nécessairement un groupe homogène du point de vue des antécédents matrimoniaux. Les décédés déclarés comme mariés au moment du décès ont pu avoir été précédemment divorcés ou veufs; de même, les veufs ont pu être antérieurement divorcés et vice versa. Il convient de tenir compte de ce facteur pour interpréter les différences entre groupes.

Tableau 22

Pour la deuxième fois, l'*Annuaire démographique* donne ici des statistiques sur la répartition des décès de personnes du sexe masculin selon l'âge et la profession du décédé. Ces données qui se rapportent à 1957-1960 ne sont pas comparables; elles ont surtout pour objet de donner une idée du nombre des pays où les statistiques des décès sont ainsi exploitées depuis quelques années et de stimuler l'établissement de statistiques comparables sur cet aspect de la mortalité. Un tableau contenant des séries pour 14 pays et territoires a été publié dans l'*Annuaire démographique* de 1957; il se rapportait principalement à une année de la période 1952-56.

Le tableau 22 ne comporte que des statistiques concernant le sexe masculin, car les données pour le sexe féminin n'ont guère d'utilité du point de vue de l'analyse; s'il en est ainsi, c'est parce que l'exercice d'une profession est beaucoup moins répandu chez les femmes que chez les hommes et qu'une grande partie des femmes qui ont un emploi le quittent au mariage. Dans ces conditions, la répartition des décès du sexe féminin selon la profession montre que la grande majorité de ces décès se rangent dans la catégorie "inclassables". En classant les décès de femmes mariées selon la profession du mari (comme on le fait au Royaume-Uni), on peut évaluer l'influence de la situation socio-économique, indépendamment de la profession.

Les statistiques du tableau 22 se présentent sous la forme où les autorités de chaque pays les ont communiquées. On n'a pas essayé en effet de normaliser la classification des professions; il n'y a d'ailleurs pas moyen de savoir si les données nationales étaient, à l'origine, exploitées selon la formule adoptée pour le tableau 22.

On suppose que la profession s'entend *du métier, de l'activité professionnelle ou du genre de travail exercé ou effectué par l'individu*[58].

La classification recommandée comprenait 10 catégories correspondant aux grands groupes de la Classification internationale type de professions (CITP)[59]; 12 pays ont fourni des données sous cette forme et 3 ont utilisé une classification différente. Au Salvador, la classification employée est celle du CRPA[60], qui est étroitement liée à la CITP; l'Italie et la Yougoslavie utilisent une classification qui leur est propre. Aucune de ces classifications n'est directement comparable aux autres et la prudence s'impose dans tout essai de comparaison.

L'âge est exprimé en "années révolues" c'est-à-dire qu'il est calculé en retranchant la date de la naissance (jour, mois et année) de celle du décès (jour, mois et année). Les groupes d'âge sont au nombre de 9, à savoir : moins de 15 ans, 15-19 ans, 20-24 ans, 25-34 ans, 35-44 ans, 45-54 ans, 55-64 ans, 65 ans et plus et inconnu. A l'exception du dernier groupe d'âge, c'est la même répartition qui sert pour l'étude de la population selon la profession et l'âge à la date du recensement, conformément aux recommandations internationales[61].

Les données discutables (incomplètes) où dont le degré d'exactitude n'est pas connu sont reproduites en italique. Voir explications à la page 65.

Portée : Au total, 15 pays et territoires sont en mesure de fournir des statistiques des décès du sexe masculin classés selon la profession.

Insuffisances des données : Les statistiques des décès selon la profession, qui souffrent de toutes les limitations inhérentes aux statistiques de la mortalité en général, ap-

pellent aussi d'autres réserves qui tiennent principalement à la collecte des données et à la codification. Ces réserves ayant été remarquablement exposées dans une étude du Bureau international du Travail[62], seuls les problèmes les plus évidents seront mentionnés ci-après. Le premier a trait au rassemblement des données.

Dans le bulletin statistique pour les décès, la question sur la profession est rédigée de diverses manières qui se ramènent finalement à deux types principaux. Elle porte parfois sur la profession effective du décédé, au moment de sa mort, parfois sur la profession *habituelle.* L'existence de ces deux formes de question soulève des problèmes de comparabilité, en particulier pour les personnes âgées qui étaient en retraite à la date de leur décès. Dans certains pays, il arrive qu'on indique leur ancienne profession tandis que, dans d'autres, on donne la profession du moment (retraité). Des renseignements plus détaillés sur les pratiques suivies à cet égard figurent à la page 202 et au tableau 14 du *Manuel de statistique de l'état civil, op. cit.*

Autre source d'erreur importante : la personne qui établit le bulletin de décès n'est pas toujours bien au courant de la profession du défunt et peut donc faire une réponse inexacte. Toutefois, les erreurs de ce genre ne peuvent pas être beaucoup plus graves que celles qui se glissent dans les déclarations d'âge. D'ailleurs, il est probable que ces erreurs seront estompées en raison de l'étendue des catégories de la classification employée pour le tableau 22.

La comparabilité peut être compromise également par le mode de codification et de classification de la profession indiquée. C'est seulement à une date récente qu'on a établi des normes internationales acceptables de classification et, dans l'intervalle, beaucoup de pays ont utilisé leur propre classification. En pareil cas, il y aurait peut-être moyen d'assimiler les diverses catégories détaillées à celles de la norme internationale, mais il ne faut pas compter assurer la comparabilité au niveau des 10 groupes de la classification abrégée. Ainsi, même pour les données qui paraissent classées selon le même critère, le doute s'impose tant qu'on n'est pas renseigné davantage sur la codification de base.

Enfin, il est à noter que certaines des répartitions établies ne s'appliquent qu'à la population économiquement active. D'autres concernent toutes les personnes qui ont fait partie de la population active à *un moment quelconque,* c'est-à-dire la population active plus les retraités. Pour tenir compte de ces cas, on a prévu une onzième catégorie — sans profession — où figure le reste des décès. On remarquera que, s'il n'y a pas de catégorie "sans profession" et si le nombre des décès inclassables ailleurs est élevé, il y aura tout lieu de soupçonner que les personnes sans profession au moment du décès ont été rangées dans la catégorie "inclassables". De toute manière, il est mauvais qu'une répartition comporte une forte proportion de décès non classés selon la profession et, dans les travaux d'analyse, il importe d'interpréter ces statistiques avec prudence.

Tableau 23

Pour la deuxième fois, des taux de mortalité selon la profession, l'âge et le sexe sont publiés dans l'*Annuaire démographique.* Ces taux, qui sont les plus récents que l'on ait pu se procurer, ont été calculés par les services de statistique des pays intéressés. Leur présentation dans le présent *Annuaire,* comme dans celui de 1957, a pour but d'encourager ce genre d'analyse de la mortalité.

On suppose que les définitions de l'âge et de la profession sont les mêmes que celles qui ont été utilisées pour établir les chiffres absolus du tableau 22 même si ces derniers n'ont pas toujours servi de base au calcul des taux en question.

Afin d'éliminer certains des problèmes à résoudre pour assurer la concordance entre la profession indiquée dans le bulletin de recensement et celle qui figure dans la déclaration de décès, on a dans chaque cas adopté une classification très simplifiée. Cette absence de détails permet aussi d'écarter le problème de la durée pendant laquelle le défunt avait effectivement exercé la profession qui lui est attribuée dans le classement. Il est probable, en effet, que la mobilité entre les grands groupes prévus n'est pas importante.

La classification par âge est celle du tableau 22 et celle aussi que l'on retient généralement pour la répartition de la population selon la profession, l'âge et le sexe.

Portée : 4 pays seulement figurent dans le tableau 23, à savoir le Japon, la France, l'Angleterre et le Pays de Galles et l'Ecosse.

Calcul des taux : Les taux représentent le nombre de décès survenus dans chacun des groupes définis par l'âge, le sexe et la profession, pour 100 000 personnes du même groupe. Le Bureau de statistique n'a pas essayé de calculer des taux car il se pose une multitude de problèmes de concordance qu'on ne peut résoudre sans bien connaître le détail des données de base, leur définition et les méthodes d'établissement de ces données. On trouvera dans les publications nationales sur la question[63] des renseignements précis concernant les méthodes employées et les ajustements effectués pour assurer la concordance entre le champ des données sur les décès et la population "exposée aux risques de décès" dans les séries publiées.

Insuffisances des données : Toutes les réserves formulées à propos du tableau 22 sont également valables ici. En outre, il est extrêmement difficile de faire concorder la population "exposée" et le champ des données sur les décès.

Comme on l'a noté plus haut, l'élargissement des catégories professionnelles aide à atténuer certaines des divergences éventuelles. Il est aussi plus facile d'éviter certaines difficultés particulières en limitant la répartition aux individus du sexe masculin et d'âges déterminés. Cependant, le problème essentiel est de déterminer si les taux en question sont satisfaisants; à cette fin, il faut déterminer les différences entre les professions mentionnées dans les bulletins de recensement de la population et celles qui sont indiquées dans les certificats de décès établis par les services de l'état civil. Une étude faite aux Etats-Unis et une autre au Royaume-Uni donnent une idée de l'importance de ces différences.

[62] Bureau international du Travail. Les méthodes de la statistique de la morbidité et de la mortalité professionnelles. Genève, 1930, 232 pages. [*Etudes et documents, série N* (Statistique), n° 16].

[63] France, Institut national de la statistique et des études économiques, "La mortalité par catégorie socio-professionnelle", *Etudes statistiques,* N° 3, Paris, juillet-septembre 1957, p. 39-44. Royaume-Uni, General Register Office, *The Register General's Decennial Supplement, England and Wales,* 1951 (Occupational Mortality, Part I), Londres, 1954, 75 pages.

Aux Etats-Unis, on a entrepris une enquête pour déterminer le degré de correspondance entre la profession mentionnée dans les certificats de décès des blancs (sexe masculin) âgés de 45 à 64 ans et décédés au cours de la période mai-août 1950 et celle qui figure sur les bulletins de recensement correspondants remplis le 1er avril 1950. Le document de référence[64] fournit tous les détails voulus sur la méthode utilisée.

On notera que le registre des décès comporte une rubrique concernant la "profession habituelle" ainsi que la branche d'activité où cette profession est exercée, que le décédé ait ou non un emploi à la date du décès. Sur les bulletins de recensement de 1950, il fallait indiquer si le recensé faisait partie de la main-d'œuvre, c'est-à-dire s'il occupait un emploi ou en cherchait un au moment du recensement et, pour chaque membre de la population active, il fallait préciser la profession exercée à ce moment-là ou la dernière activité professionnelle, selon qu'à la date indiquée le recensé occupait un emploi ou en cherchait un. C'est ainsi que, conformément à la définition utilisée pour le recensement, aucune question concernant l'activité professionnelle n'est posée au sujet des personnes n'appartenant pas à la main-d'œuvre au moment du recensement, c'est-à-dire au sujet des retraités, des personnes incapables de travailler, de celles qui fréquentent l'école, etc. Cela explique certaines des différences soulignées dans l'étude; en fait, il s'agit là du facteur qui fausse le plus la correspondance entre le numérateur et le dénominateur servant à calculer les taux de mortalité selon la profession.

La comparabilité des déclarations sur la profession a également été étudiée dans une enquête du *General Register Office* du Royaume-Uni consacrée à l'examen critique des résultats du recensement effectué en 1951 en Angleterre et dans le Pays de Galles[65]. Pour faire cette étude, on a comparé les certificats de décès se rapportant à la semaine allant du 1er au 7 mai 1951 aux bulletins de recensement remplis le 8 avril 1951. En Angleterre et dans le Pays de Galles, la question posée lors du recensement et l'enregistrement du décès se rapporte à la profession "actuelle" (ou la dernière profession si l'intéressé est en retraite au moment du recensement ou du décès) alors qu'aux Etats-Unis on demande la profession courante ou habituelle. L'étude britannique conclut en ces termes[66] :

> "En résumé, on peut dire que si la classification selon la profession est parfois faussée par l'action combinée des facteurs qui lui sont propres et par la tendance humaine à employer des mots différents pour décrire des situations identiques, on a l'impression générale que le degré de fiabilité de la répartition professionnelle établie au moment du recensement justifie les analyses statistiques qui reposent sur les données recueillies. Les divergences entre les données de recensement et celles qui sont établies à partir des registres de décès peuvent ou non être flatteuses pour la situation sociale du décédé, mais dans l'ensemble l'enregistrement des décès a plus tendance que le recensement à présenter sous un jour favorable la situation sociale d'un groupe déterminé. Il semble vraisemblable que le recensé, au moment du dénombrement, et sa veuve (ou le déclarant) au moment de l'enregistrement du décès ont tendance à décrire son emploi récent en termes flatteurs ou à indiquer une profession antérieure si elle leur semble s'accompagner d'une plus grande considération, mais les déclarations faites à l'occasion du dénombrement comportent un nombre relativement moins élevé d'erreurs de ce genre, car le recensement s'effectue dans une atmosphère d'enquête objective et fait l'objet de prescriptions réglementaires; de plus, les opérations de recensement sont entourées de plus de publicité et sont mieux expliquées que l'enregistrement des décès. Cependant, l'altération de la répartition socio-économique de la population ne saurait nuire sérieusement à la valeur de l'analyse de la mortalité selon la profession."

Il ne faut pas oublier enfin l'influence que peut exercer un facteur non professionnel comme l'état matrimonial. La mortalité varie avec l'état matrimonial et ses variations peuvent empêcher de discerner clairement les différences dues à la profession[67].

Tableau 24

On trouvera au tableau 24 "l'espérance de vie" ($\mathring{e}_x$), ou nombre moyen d'années restant à vivre, des personnes du sexe masculin et du sexe féminin atteignant les âges indiqués et soumis aux conditions de mortalité de la période visée par la table. Ces données proviennent des tables officielles de mortalité des pays auxquels elles se rapportent; aucune fonction n'a été calculée par le Bureau de statistique des Nations Unies.

Ce tableau donne les valeurs de l'espérance de vie extraites de toutes les tables de mortalité — complètes ou abrégées — pour la période 1940-1960. En ce qui concerne la période 1900-1940, l'*Annuaire démographique* de 1957 présente des fonctions pour les âges ci-après : 0, 1, 2, 5, 10, 15, 20, 30, 40, 50, 60 65 et 70 ans et l'*Annuaire démographique* pour les mêmes âges ou groupes d'âge que le tableau 24.

Dans le tableau 24 les chiffres sont présentés séparément pour chaque sexe à partir de la naissance (âge 0) et pour les âges suivants : 1, 2, 3, 4, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80 et 85 ans.

Les chiffres ont été reproduits tels qu'ils ont été communiqués par les services officiels, ce qui explique qu'ils comportent tantôt une et tantôt deux décimales.

Etant donné que cette fonction est extraite d'une table officielle de mortalité et qu'on suppose que les données de base (chiffres de population et chiffres des décès selon l'âge et le sexe) ont été, en cas de besoin, ajustées avant l'élaboration de la table de mortalité, le Bureau de statistique n'a pas cherché à évaluer la qualité des données et par conséquent aucune d'entre elles n'est reproduite en italique.

Portée : Les valeurs figurant dans le tableau 24 se rapportent à 83 pays et territoires. Faute de données de base acceptables, le nombre des pays pour lesquels des tables de mortalité ont pu être établies est réduit, mais on a constaté, ces dernières années, un élargissement notable de la portée géographique de ces statistiques.

Insuffisances des données : Les valeurs de l'espérance de vie appellent toutes les réserves formulées à la page 69 à

[64] *The Comparability of Reports on Occupation from Vital Records and the 1950 Census, op. cit.*

[65] *1951 Census of England and Wales, General Report, op. cit.*

[66] *Ibid.*, p. 55-56.

[67] Pour un examen plus détaillé, voir : *Les méthodes de la statistique de la morbidité et de la mortalité professionnelles, op. cit.*

propos des tables de mortalité, en outre, elles sont soumises aux mêmes limitations que les statistiques de la population et de la mortalité en général.

Peut-être le principal défaut inhérent aux valeurs de l'espérance de vie est-il que lorsqu'on interprète les données en question il ne faut jamais oublier que, par hypothèse, les groupes de survivants sont soumis, pour chaque âge, aux conditions de mortalité de la période visée par la table de mortalité. Ainsi peut-on dire, à propos de la valeur $\mathring{e}_{50}$ dans la table de mortalité de 1945-1950 relative à la Norvège, que si les hommes atteignant l'âge de 50 ans restent soumis aux mêmes conditions de mortalité que pendant la période 1945-1950, ils vivront encore en moyenne 26,4 années, c'est-à-dire jusqu'à l'âge de 76,4 ans. Toutefois, l'évolution qui s'est produite au cours des dernières décennies a montré que la mortalité ne saurait être considérée comme stable; cela reviendrait à sous-évaluer l'espérance de vie, car la mortalité fléchit presque partout.

Tableau 25

Le tableau 25 indique, pour la période 1940-1960, les quotients de mortalité par sexe, c'est-à-dire la probabilité de décès, dans le délai d'un an (ou dans un intervalle d'âge déterminé), des personnes du sexe masculin ou féminin qui ont atteint exactement l'âge indiqué au-dessus de chaque colonne du tableau. Ces quotients constituent la fonction fondamentale de la table de mortalité, habituellement désignée par q_x, "x" représentant l'âge. Les valeurs de q_x figurant dans le tableau sont exprimées en 1 000 q_x et indiquent le nombre de décès pendant l'année parmi 1 000 personnes atteignant l'âge "x" ou encore la probabilité de décès, dans un délai d'un an (ou dans l'intervalle d'âge indiqué), de 1 000 personnes ayant atteint l'âge "x". Le tableau 25 comprend 22 rubriques d'âge : 0, 1, 2, 3, 4, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80 et 85 ans.

Les quotients de mortalité diffèrent des taux de mortalité en ce qu'ils se rapportent à des personnes atteignant un âge déterminé au cours d'une année et non à des personnes atteignant cet âge au milieu de l'année. Les quotients reposent donc sur la même conception que les taux de mortalité infantile présentés au tableau 14. Cependant, les quotients de mortalité pour les enfants de moins de 1 an diffèrent généralement des taux de mortalité infantile du tableau 14 en raison de l'ajustement qu'ils comportent, les décès étant rapportés à la cohorte de naissances correspondante.

Les tables de mortalité complètes donnent des quotients pour chaque année d'âge. Au contraire, les tables abrégées ne donnent des valeurs que pour des groupes d'âge, généralement quinquennaux. Certaines séries du tableau 25 sont du deuxième type, ce que l'on a indiqué par des "entêtes" supplémentaires dans les colonnes. Le quotient de mortalité est alors la probabilité de décès des personnes d'âge donné au cours de l'année suivante, mais de la période de plusieurs années visée par la table.

Etant donné que cette fonction est extraite d'une table officielle de mortalité et qu'on suppose que les données de base (chiffres de population et chiffres des décès selon l'âge et le sexe) ont été, en cas de besoin, ajustées avant l'élaboration de la table de mortalité, le Bureau de statistique n'a pas cherché à évaluer la qualité des données et par conséquent aucune d'entre elles n'est reproduite en italique.

Portée : Les quotients reproduits dans le tableau 25 concernent 69 pays ou territoires. Faute de données de base acceptables, le nombre des pays pour lesquels des tables de mortalité ont pu être établies est réduit mais on a constaté, ces dernières années, un élargissement notable de la portée géographique de ces statistiques.

Insuffisances des données : Les quotients de mortalité appellent toutes les réserves applicables aux statistiques de population et aux statistiques de l'état civil en général. La méthode utilisée pour calculer les quotients a été brièvement décrite à la page 69. Le calcul des valeur q_x pour les premiers âges et les âges avancés pose des problèmes spéciaux. On établit souvent les valeurs de q_x pour les premiers âges à partir des statistiques des naissances survenues au cours des années voisines en faisant une estimation du nombre d'enfants risquant de mourir pendant la période à laquelle se rapporte la table de mortalité. Pour les âges avancés, les données sont souvent si rares et si discutables qu'il faut sensiblement les remanier pour pouvoir obtenir une série vraisemblable de valeur de q_x. Dans de nombreux cas, les valeurs de q_x figurant dans la table de mortalité pour les âges avancés ne sont nullement liées aux décès enregistrés pour ces âges; elles sont établies par estimation à partir des valeurs de q_x concernant les personnes moins âgées.

Bien que l'on ait rectifié les écarts dus aux déclarations d'âge erronées pour obtenir, d'un âge à l'autre, une série de valeurs d'allure régulière, la comparabilité des données risque d'être compromise par les différences de méthode d'ajustement.

Tableau 26

On a groupé dans le tableau 26 toutes les tables de survie pour le sexe masculin et le sexe féminin qui ont été extraites des tables officielles de mortalité concernant la période comprise entre 1940 et 1960.

Les valeurs figurant dans ces tables, généralement désignées par l_x, sont calculées à partir des valeurs q_x de la table de mortalité; elles représentent le nombre de personnes du sexe masculin ou féminin appartenant à une même cohorte de naissances vivantes et soumises à la mortalité définie par les quotients de la table de mortalité correspondante qui survivent jusqu'à chacun des âges indiqués. En d'autres termes, ces valeurs indiquent la proportion des personnes nées vivantes qui ont des chances de survivre jusqu'à un âge déterminé "x".

Dans le tableau 26, la racine des tables de survie (effectif initial de la cohorte) est généralement de 100 000, mais dans certains cas elle n'est que de 10 000 ou 1 000. Les âges retenus sont 0, 1, 2, 3, 4, 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60, 65, 70, 75, 80 et 85 ans.

Etant donné que cette fonction est extraite d'une table officielle de mortalité et qu'on suppose que les données de base (chiffres de population et chiffres des décès selon l'âge et le sexe) ont été, en cas de besoin, ajustées avant l'élaboration de la table de mortalité, le Bureau de statistique n'a pas cherché à évaluer la qualité des données et par conséquent aucune d'entre elles n'est reproduite en italique.

Portée : Le tableau 26 fournit des statistiques de survie pour 69 pays ou territoires. Comme on l'a dit à propos des tableaux 24 et 25, le nombre des pays pour lesquels on

dispose de tables de survie s'est accru malgré l'insuffisance générale des données de base.

Insuffisances des données : Comme les autres fonctions de la table de mortalité, les nombres de survivants appellent toutes les réserves générales applicables aux statistiques de la population et de la mortalité; en outre, leur comparabilité est comprise par les différences entre les méthodes utilisées pour construire les tables de mortalité (voir page 69).

Comme on l'a déjà signalé à propos du tableau 25, les incertitudes relatives aux quotients de mortalité pour les premiers âges et les âges très avancés posent un problème spécial; en conséquence, les chiffres obtenus pour ces âges, en particulier pour les âges très avancés, n'ont guère plus de valeur que des estimations.

Tableau 27

On verra cette année dans le tableau 27 ce qu'ont été les tendances annuelles de la nuptialité et des taux de nuptialité pendant la période 1952-1961.

Sauf indication contraire, les statistiques se rapportent à des mariages célébrés officiellement, c'est-à-dire à l'union légale de personnes de sexe différent, l'union pouvant être rendue légale par une procédure civile ou religieuse ou par toute autre procédure reconnue par la loi du pays. Ce sont des statistiques des mariages, non des statistiques des personnes qui se marient.

Conformément à la pratique habituelle le symbole (C, U ou . . .) qui figure dans la première colonne du tableau indique la qualité des données; en outre, les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. Voir explications à la page 65.

Portée : Le tableau 27 donne des statistiques de la nuptialité et des taux bruts de nuptialité pour 153 pays et territoires. Tous les pays importants figurent dans la nomenclature du tableau, même ceux pour lesquels on ne possède pas de données récentes; en l'absence de statistiques pour l'ensemble d'un pays, on a présenté des données pour de petits groupes de population. Ces données n'ont guère de valeur en elles-mêmes, mais elles permettent d'identifier les pays pour lesquels il existe des statistiques de la nuptialité de portée nationale. Etant donné que les taux calculés sur de très petits nombres sont sujets à des erreurs importantes, on a exclu quelques pays ou territoires accusant régulièrement des fréquences inférieures à 15.

Calcul des taux : Les taux du tableau 27 indiquent le nombre de mariages enregistrés pour 1 000 personnes présentes au milieu de l'année considérée. Les chiffres de population sont les chiffres officiels et, en général, ceux qui figurent dans le tableau 4. On s'est efforcé de réaliser une correspondance rigoureuse entre le numérateur du taux (mariages) et le dénominateur (population) ; on a indiqué en note les cas où cette correspondance a été impossible.

Insuffisances des données : Presque toutes les réserves faites à propos des statistiques de l'état civil à la page 64, et toutes celles qui ont été formulées au sujet des statistiques de la nuptialité en particulier, s'appliquent aux données du présent tableau. Leur qualité varie en raison des différences qui existent d'un pays à un autre dans les définitions utilisées aux fins de la statistique; dans la mesure où elles ne tiennent pas compte des unions consensuelles, elles donnent une idée trompeuse de la formation des familles biologiques; enfin, si elles sont incomplètes, elles ne donnent même pas une bonne indication du nombre des mariages reconnus par la loi. Toutefois, il importe de souligner que, le mariage étant un acte juridique et non un fait biologique, le problème de la comparabilité des données du point de vue de la complétude se présente sous un aspect un peu différent. Il convient d'en tenir compte pour interpréter les notations codiques (C ou U) qui indiquent la qualité des données dans la première colonne du tableau.

Les taux sont d'excellents indices de la fréquence des unions consensuelles, car, pour les mariages reconnus par la loi, l'intervalle de variation des taux est assez étroit; les variations marquées sont donc presque toujours dues à une prépondérance des unions de fait par rapport aux unions de droit. L'influence de ce facteur sur la comparabilité des données est particulièrement évidente pour certaines parties de l'Amérique latine et de l'Afrique où les taux de nuptialité sont anormalement faibles.

Comme on le verra dans les notes, il n'a pas toujours été possible, pour le calcul des taux, d'obtenir une correspondance rigoureuse entre le numérateur et le dénominateur. Par exemple, les mariages parmi la population civile et les militaires sont parfois rapportés à la population civile. Cela peut avoir pour effet d'accroître les taux; au contraire si la population de base englobe un plus grand nombre de personnes que celle dans laquelle les mariages ont été comptés, les taux seront plus faibles, mais, dans la plupart des cas, il est probable que la différence sera négligeable. Voir à ce sujet la série des taux pour Gibraltar.

Le signe (†) sert ici, comme ailleurs dans l'*Annuaire démographique,* à indiquer que les statistiques ont été établies d'après la date de l'enregistrement, et non d'après celle de l'événement, c'est-à-dire, dans le cas présent, de la célébration. Comme on l'a signalé à la page 67, cette précision n'est pas très importante en ce qui concerne les mariages, étant donné que, dans la plupart des cas, l'enregistrement est la condition préalable à la célébration ou se confond avec elle. Dans certains pays cependant, il s'écoule parfois un laps de temps assez long entre la célébration du mariage et son enregistrement[68]; il faudra donc en tenir compte pour interpréter les données.

Enfin, il convient de souligner que les taux bruts de nuptialité — de même que les taux bruts de natalité et de mortalité — ne sont pas des indices de probabilité, puisqu'ils ne tiennent pas compte de la répartition selon l'âge, le sexe et l'état matrimonial de la population à laquelle ils se rapportent. Néanmoins, ils mesurent les niveaux de la nuptialité et les fluctuations de la fréquence des mariages. Pour plus de détails sur l'utilisation des taux bruts de nuptialité, voir le chapitre I de l'*Annuaire démographique* de 1958.

Tableau 28

Le tableau 28 indique le nombre de mariages classés selon l'âge de l'épouse, d'une part, et selon l'âge de l'époux,

[68] *Manuel de statistique de l'état civil, op. cit.,* tableau 10, p. 100-101.

d'autre part, en ce qui concerne l'année la plus récente pour laquelle on possède des chiffres. Ce tableau, où est indiqué l'âge des conjoints au moment du mariage, constitue l'un des 16 tableaux publiés annuellement depuis 1957.

L'âge est exprimé en années révolues au dernier anniversaire, conformément aux recommandations de l'Organisation des Nations Unies[69], c'est-à-dire que pour le calculer on soustrait la date de la naissance (jour, mois et année) de celle du mariage (jour, mois et année). Le classement par âge est celui qu'a recommandé l'Organisation des Nations Unies[70], modifié de façon à gagner un peu de place; on a utilisé 12 catégories : moins de 15 ans, groupes quinquennaux jusqu'à 59 ans, 60 ans et plus, et enfin âge inconnu. On a adopté la même classification pour les deux sexes.

Une innovation a été introduite dans ce tableau qui, pour la première fois, comporte deux colonnes indiquant l'âge minimum au mariage pour le sexe féminin ainsi que pour le sexe masculin. "L'âge de nubilité" est celui que doivent atteindre les futurs époux pour pouvoir contracter un mariage valable au regard de la loi. Passé cet âge, les futurs époux doivent, dans la plupart des pays, obtenir le consentement de leurs parents ou tuteurs et cela, jusqu'à ce qu'ils aient atteint un âge plus avancé, généralement 21 ans. Dans certains pays, la loi prévoit que l'autorité compétente peut, dans des cas déterminés, accorder une dispense en ce qui concerne l'âge minimum; dans d'autres (Royaume-Uni, Nouvelle-Zélande, etc.) il n'existe rien de semblable. On a inclus dans le tableau 28 les renseignements qui permettent de mieux saisir la signification des données selon l'âge jusqu'à 24 ans.

Les données classées comme discutables (incomplètes) par application du code de qualité (voir page 65) sont reproduites en italique. Si l'on admet que ces données sont incomplètes au même degré pour tous les âges, on peut dire qu'elles permettent de se faire une idée de la façon dont les mariages se répartissent selon l'âge, même si les nombres absolus sont inexacts.

Portée : On trouvera dans le tableau 28 des statistiques de la nuptialité selon l'âge des conjoints pour 114 pays ou territoires, indépendants ou non; les seuls pays ou territoires qui n'y figurent pas sont ceux pour lesquels les statistiques portent sur moins de 50 mariages. Tous les pays importants figurent dans la nomenclature du tableau, même ceux pour lesquels on ne possède pas de données récentes; en l'absence de statistiques pour l'ensemble de la population, on a présenté des données pour de petits groupes ethniques.

Insuffisances des données : Toutes les imperfections relatives aux statistiques de l'état civil en général et aux statistiques de la nuptialité en particulier influent sur la comparabilité des données du tableau 28. Comme pour le tableau 27, on a supposé qu'il fallait entendre par mariages les unions officiellement reconnues, contractées conformément à la loi de chaque pays. Toutes les exceptions à cette norme sont signalées dans des notes; il s'agit notamment des cas où les statistiques reposent sur le nombre des autorisations de mariage délivrées ou des mariages inscrits sur les registres des églises seulement, ou encore des cas où elles comprennent les unions reconstituées après une séparation, etc.

Le facteur âge compte aussi parmi les causes d'erreur. L'influence des erreurs de déclaration d'âge dans les recensements de population a été étudiée à la page 62. Il est probable que les statistiques de la nuptialité sont moins faussées par ce genre d'erreur, quand les renseignements sont donnés par les intéressés eux-mêmes, et, comme il s'agit d'un acte juridique, les déclarations faites pour l'enregistrement du mariage sont probablement exactes. Toutefois, dans certains cas, il semble y avoir une concentration anormale des mariages à l'âge minimum de nubilité ainsi qu'à l'âge auquel le mariage peut être valablement contracté sans le consentement des parents, ce qui peut indiquer que certains déclarants se vieillissent pour se conformer à la loi. Parmi les facteurs pouvant exercer une influence sur les déclarations d'âge, en particulier celles qui sont faites par des personnes plus âgées, il faut citer la tendance des femmes à se donner un âge soit égal soit inférieur à celui de l'époux.

Pour les premiers âges, c'est-à-dire jusqu'à 24 ans, la comparabilité des données d'un pays à l'autre risque également d'être limitée par les variations de l'âge minimum au mariage. On n'a pas à ce sujet de données pour tous les pays, mais il semble que si les taux concernant les âges en question varient sensiblement d'un pays à l'autre, c'est moins en raison des caractéristiques de la nuptialité qu'en raison des différences existant, sur le plan international, entre les conditions légales de validité du mariage civil. L'inclusion, dans le tableau 28, de l'âge de nubilité pour un certain nombre de pays devrait présenter un certain intérêt à ce point de vue.

Les réserves qu'implique le code de complétude figurant au tableau 27 et qui valent également pour les données du tableau 28 méritent d'être prises en considération, mais, comme on l'a expliqué plus haut, la signification des codes n'est pas toujours claire pour ce qui est de l'enregistrement des mariages. Quant aux erreurs découlant de l'exploitation des données selon la date de l'enregistrement, elles sont négligeables dans le cas du tableau 28.

Tableau 29

On verra cette année dans le tableau 29 ce qu'ont été les tendances annuelles de la divortialité et des taux bruts de divortialité pendant la période 1952-1961.

Sauf indication contraire, les données représentent les dissolutions de mariage définitives résultant de jugements de divorce rendus à l'intérieur des frontières actuelles des pays énumérés pour la population présente. Il ne s'agit pas du nombre de personnes divorcées, mais du nombre de jugements de divorce prononcés.

Conformément à la pratique habituelle, le symbole (C, U ou . . .) qui figure dans la première colonne du tableau indique la qualité des données; en outre, les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. Voir explications à la page 65.

Portée : Les chiffres annuels publiés dans le tableau 29 concernent 109 pays ou territoires. Les pays importants y sont représentés, même si l'on ne possédait pas de données récentes à leur sujet. Dans les cas où des statistiques sur l'ensemble de la population faisaient défaut, on a publié les données partielles. On a voulu ainsi non seulement

[69] *Principes directeurs d'un système de statistiques de l'état civil, op. cit.*, Principe 309 c) 1).
[70] *Ibid.*, Principe 410 e) 23).

fournir des renseignements sur la fréquence des divorces mais aussi montrer quels sont les pays qui établissent des statistiques de la divortialité. Les pays ou territoires où il n'existe pas de dispositions légales sur le divorce sont signalés dans des notes.

Calcul des taux : Les taux du tableau 29 représentent le nombre de jugements de divorce prononcés pour 1 000 personnes présentes sur le territoire au milieu de l'année en question. Dans les quelques cas où l'on ne possédait pas de chiffres pour le milieu de l'année, on a utilisé les résultats du recensement ou une estimation pour une autre date de l'année. Les chiffres de population, qu'ils se rapportent au milieu de l'année ou à toute autre date de l'année, sont les chiffres officiels et, en général, ceux qui figurent dans le tableau 4.

Insuffisances des données : La comparabilité des statistiques de la divortialité est limitée par plusieurs des facteurs mentionnés au sujet des statistiques de l'état civil en général et des statistiques de la divortialité en particulier (voir pages 64 et 70). Il se peut que les divorces comprennent en fait les annulations ou les séparations légales, ou les unes et les autres, selon la méthode de classement et d'exploitation employée. Là où les divorces sont peu nombreux, il n'est probablement pas établi de statistiques distinctes.

Comme les statistiques de la divortialité ont leur source dans les archives et les actes des tribunaux, il est probable que les fluctuations annuelles accusées traduiront le rythme plus ou moins rapide auquel les affaires sont jugées plutôt que l'évolution de la fréquence des divorces. En outre, elles montrent dans quelle mesure il est facile ou difficile d'obtenir un divorce, selon le caractère plus ou moins strict de la législation sur les causes de divorce et selon la capacité des intéressés à supporter les frais de procédure. A cet égard, il convient de citer aussi l'influence de certaines religions sur la fréquence des divorces. Pour toutes ces raisons, les statistiques de la divortialité ne sont pas rigoureusement comparables et ne permettent pas de mesurer exactement la fréquence des dissolutions légales de mariages.

L'effet de la complétude des données sur les statistiques de la divortialité dépend pour beaucoup de l'origine de ces données. On trouvera une analyse détaillée de la question à la page 60 de l'*Annuaire démographique* de 1958.

Les réserves à formuler au sujet des taux de divortialité en tant qu'indices comparables dans le temps et dans l'espace sont les mêmes que celles qui sont applicables à n'importe quel taux brut. La comparabilité des données de base est limitée par les différences qui existent, d'un pays à l'autre, dans les définitions et les concepts utilisés par suite de la diversité des législations dont il a été question plus haut. La diversité des dispositions légales régissant la procédure de divorce et l'hétérogénéité des données sur lesquelles reposent les statistiques de la divortialité contribuent également au défaut de comparabilité. Par exemple, l'inclusion des annulations dans le numérateur a une influence négligeable, mais l'inclusion des séparations légales peut avoir un effet appréciable sur le taux.

Les taux bruts de divortialité — comme les taux bruts correspondants de natalité, de mortalité et de nuptialité — ne sont pas des indices de probabilité. Ils servent plutôt à indiquer l'accroissement brut de la population mariable et la diminution de la population mariée. A ce titre, leur utilité est très grande, même s'ils ne sont pas absolument comparables d'un pays à l'autre. Toutefois, en raison des différences fondamentales qui existent entre les populations du point de vue de la répartition selon l'état matrimonial et de la structure par âge, ils ne mesurent pas le risque de divorce parmi les personnes mariées ou les couples. Ils ne donnent qu'une idée générale de l'évolution de la divortialité et des différences brutes qui existent entre les pays en ce qui concerne la fréquence des divorces par rapport à la population totale, réserve faite, bien entendu, des différences d'acception du terme "divorce" d'un pays à l'autre.

TABLES

TABLEAUX

1. Area, density, population by sex and rate of population increase for each country and territory of the world : latest census, and midyear estimates for 1953 and 1960

Superficie, densité, population selon le sexe et taux d'accroissement de la population dans chaque pays et territoire du monde : dernier recensement et estimations au milieu de l'année pour 1953 et 1960

[Unless otherwise noted, population figures are modified present-in-area estimates for the present territory; area estimates include inland waters. Figures shown in boldface in estimates columns are census counts referring to different dates of enumeration. Data shown in italics are estimates of questionable reliability. For explanation of method of construction of estimates and of method of evaluation, see Technical Notes, page 21.—Sauf indication contraire, les chiffres relatifs à la population se rapportent à la population présente rectifiée du territoire actuel; les estimations de la superficie comprennent les eaux intérieures. Les chiffres en caractère gras dans les colonnes réservées aux estimations proviennent de recensements ayant eu lieu à des dates différentes. Les données en italique sont des estimations discutables. Pour la méthode utilisée afin d établir les estimations et la méthode d'évaluation, voir Notes Techniques, page 71.]

Italics indicate estimates of questionable reliability.
Boldface figures in estimates columns indicate that data are census results.

* Provisional.
[1] For explanation of code, see page 15.
[2] Population per square kilometre of area in 1960.
[3] Including Southern Cameroons, which was formerly a part of United Nations Trust Territory of the Cameroons under British Administration, and which became part of the Republic of Cameroun on 1 October 1961.
[4] Non-indigenous population only in area excluding Southern Cameroons, a census of which, held in June 1953, gave a total population of 753 358.
[5] For non-indigenous population only.
[6] For 1952-60. [6a] For 1 January 1959.
[7] Estimate, based on results of demographic sample survey of indigenous population.
[8] Includes additional estimate for certain areas not covered by survey.
[9] Appears not to be in accord with results of latest census, shown adjacent.
[10] Estimate, based on results of 1955 demographic sample survey covering approximately 300 000 persons of both sexes.
[11] Population excludes alien armed forces stationed in the area.
[12] For 1954-60.
[13] Population is *de jure*.
[14] Excludes population of southern part of Northern Zone (former Spanish Protectorate), which was transferred by Spain 10 April 1958.
[15] Estimate, based on provisional results of 1959-1960 demographic sample survey of 399 villages and excluding population of the city of Niamey (numbering 122 672 at census of April 1959) the Cercle of Agadez, the nomad Subdivision of Tahoua, the northern part of the Cercles of Goure, Zinder and n'Guigmi.
[16] Including Northern Cameroons, which was formerly a part of United Nations Trust Territory of the Cameroons under British Administration, and which became a province of the Northern Region of Nigeria on 1 June 1961.
[17] Reason for discrepancy between this figure and sum of frequencies shown for male and female is inclusion in latter of rounded figures for African population of former Northern Cameroons.

Italique: estimations discutables.
Les chiffres en caractères gras dans les estimations indiquent qu'il s'agit de résultats de recensement.

* Données provisoires.
[1] Pour l'explication du code, voir page 64.
[2] Habitants par km² en 1960.
[3] Y compris la région sud du Cameroun, anciennement Territoire sous tutelle administré par le Royaume-Uni et qui fait partie de la République du Cameroun depuis le 1er octobre 1961.
[4] Le recensement, effectué en juin 1953, de la population non indigène seulement non compris la région sud du Cameroun, a donné un total de 753 358 personnes.
[5] Population non indigène seulement.
[6] Pour 1952-60. [6a] Au 1er janvier 1959.
[7] D'après les résultats de l'enquête démographique par sondage sur la population indigène.
[8] Y compris une estimation additionelle pour certaines régions non couvertes par l'enquête.
[9] Semble ne pas être en accord avec les résultats du dernier recensement ci-joint.
[10] D'après les résultats de l'enquête démographique par sondage de 1955 qui portait sur environ 300 000 personnes des deux sexes.
[11] Non compris les militaires étrangers en garnison sur le territoire.
[12] Pour 1954-60.
[13] Population de droit.
[14] Non compris la population de la partie sud de la zone nord (ancien Protectorat espagnol) dont la cession au Maroc a été décidée le 10 avril 1958.
[15] D'après les résultats provisoires de l'enquête démographique par sondage de 1959-1960 qui portait sur 399 villages et qui excluait la population de la ville de Niamey (122 672 habitants au recensement d'avril 1959) le Cercle d'Agadez, la Subdivision nomade de Tahoua, la partie Nord des Cercles de Goure, Zinder et n'Guigmi.
[16] Y compris la région septentrionale du Cameroun, anciennement territoire sous tutelle administré par le Royaume-Uni et qui fait partie de la région septentrionale de la Nigéria depuis le 1er juin 1961.
[17] La différence entre ces données et le total des chiffres de la population du sexe masculin et du sexe féminin s'explique par l'arrondissement du chiffre de la population africaine féminine de l'ancien Cameroun septentrional.

Italics indicate estimates of questionable reliability.
Boldface figures in estimates columns indicate that data are census results.

* Provisional.
[1] For explanation of code, see page 15.
[2] Population per square kilometre of area in 1960.
[5] Note suppressed.
[6] For 1952-60.
[7] Estimate, based on results of demographic sample survey of indigenous population.
[9] Appears not to be in accord with results of latest census, shown adjacent.
[13] Population is *de jure*.
[18] Estimate, based on results of 1960-1961 demographic sample survey.
[19] Former British dependency; declared independent 27 April 1961.
[20] For former Colony only, comprising the Sierra Leone Peninsula, Tasso Island, Banana Island, York Island and the township of Bonthe, which were administered as parts of the Colony.
[21] For former Italian Somaliland only; census of non-indigenous population of former British Somaliland gave total of 2 683 on 26 April 1931.
[22] For 1959.
[23] For 1953-59.
[24] Prior to 31 May 1961, known as Union of South Africa. Excluding data for Walvis Bay, which is an integral part of South Africa but is administered as if it were part of South West Africa (area 969 km²; population 12 568 in 1960).
[25] Results of sample census of population covering 1 883 380 persons, comprising 10 per cent of rural and nomadic population and 100 per cent of that in 68 towns.
[26] Formerly a United Nations Trust Territory under British administration; declared independent 9 December 1961.
[27] Population excludes non-African armed forces.
[28] Population excludes Algerian refugees temporarily in the country, estimated at about 180 000 in 1959.
[29] Includes an adjustment for underenumeration of female Moslem population.
[30] Reason for discrepancy between this figure and sum of frequencies shown for male and female is rounding of figures for the latter.
[31] Between 21 February 1958 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only. The former Syrian Region, which seceded on that date, appears as "Syria" under Asia. Data shown here are for the former Egyptian Region only.
[32] Inhabited and cultivated territory accounts for 34 815 km²; corresponding density is 745.
[32a] For 1960-61.

Italique: estimations discutables.
Les chiffres en caractères gras dans les estimations indiquent qu'il s'agit de résultats de recensement.

* Données provisoires.
[1] Pour l'explication du code, voir page 64.
[2] Habitants par km² en 1960.
[5] Note supprimée.
[6] Pour 1952-60.
[7] D'après les résultats de l'enquête démographique par sondage sur la population indigène.
[9] Semble ne pas être en accord avec les résultats du dernier recensement ci-joint.
[13] Population de droit.
[18] Estimation basée d'après les résultats d'une enquête démographique par sondage effectuée en 1960-1961.
[19] Ancienne possession britannique devenue indépendante le 27 avril 1961.
[20] Ancienne colonie seulement, comprenant la péninsule de la Sierra Leone, l'île Tasso, l'île Banana, l'île York et la ville de Bonthe, qui étaient administrées comme partie de la Colonie.
[21] Ancienne Somalie italienne seulement; le recensement de la population non indigène de l'ancienne Somalie britannique a donné un chiffre de 2 683 au 26 avril 1931.
[22] Pour 1959.
[23] Pour 1953-59.
[24] Jusqu'au 31 mai 1961, désignée sous le nom d'"Union sud-africaine". Non compris les données pour Walvis Bay, ville qui fait partie intégrante de l'Afrique du Sud mais qui est administrée comme si elle relevait du Sud-Ouest africain (superficie: 969 km²; 12 568 habitants en 1960).
[25] Résultats d'une enquête démographique par sondage portant sur 1 883 380 personnes, dont 10 pour 100 de la population rurale et nomade et 100 pour 100 de la population dans 68 villes.
[26] Ancien Territoire sous tutelle administré par le Royaume-Uni et devenu indépendant le 9 décembre 1961.
[27] Non compris les militaires des forces armées non-africaines.
[28] Non compris les réfugiés algériens temporairement dans le pays dont la population était, d'environ 180 000 en 1959.
[29] Compte tenu d'un ajustement destiné à compenser les lacunes du dénombrement de la population féminine musulmane.
[30] La différence entre ce chiffre et le total des chiffres de la population du sexe masculin et du sexe féminin s'explique par l'arrondissement du chiffre de la population féminine.
[31] Comprenaient la région égyptienne et la région syrienne entre le 21 février 1958 et le 29 septembre 1961; à partir du 29 septembre 1961, l'ancienne région égyptienne seulement. L'ancienne Région syrienne ayant fait sécession à cette date les données sont indiquées en regard de la rubrique "Syrie" sous "Asie".
l'ancienne Région égyptienne seulement.
[32] Le territoire habité et cultivé représente 34 815 km²; la densité est de 745.
[32a] Pour 1960-61.

Italics indicate estimates of questionable reliability.
Boldface figures in estimates columns indicate that data are census results.
* Provisional.
x Unofficial estimate.
[1] For explanation of code, see page 15.
[2] Population per square kilometre of area in 1960.
[5] For non-indigenous population only.
[9] Appears not to be in accord with results of latest census, shown adjacent.
[33] Including data for the two Departments of the Sahara.
[34] *De jure* population actually enumerated, but excluding persons in institutions (42 917 for both sexes), personnel in military establishments (53 374 for both sexes), merchant seamen (872), armed forces and diplomatic personnel stationed outside country, and some of the Moslem workers in France.
[35] Excludes personnel in military establishments.
[36] Comprising the islands of St. Paul and Amsterdam, the Kerguelen and Crozet Archipelagos and Adelie Coast, all former dependencies of Madagascar.
[37] Population estimated at 60 in 1953 and 103 in 1960; all male.
[38] Overseas Department of France.
[39] Overseas Province of Portugal.
[40] A 1955 census of civilized population gave a total of 117 405 (63 991 male, 53 414 female).
[41] African Province of Spain.
[42] Comprising the islands of Fernando Poo and Annobon (population numbering 40 475 and 1 403, respectively, at 1950 census).
[43] Comprising continental Guinea and the islands of Corisco and Elobeys (population numbering 156 176, 513 and 96, respectively, at 1950 census).

Italique: estimations discutables.
Les chiffres en caractères gras dans les estimations indiquent qu'il s'agit de résultats de recensement.
* Données provisoires.
x Estimation non officielle.
[1] Pour l'explication du code, voir page 64.
[2] Habitants par km² en 1960.
[5] Population non indigène seulement.
[9] Semble ne pas être en accord avec les résultats du dernier recensement ci-joint.
[33] Y compris les données pour les deux départements du Sahara.
[34] Population de droit effectivement dénombrée, mais non compris la population des institutions (42 917 personnes des deux sexes), le personnel des établissements militaires (53 374 personnes des deux sexes), les équipages de la marine marchande (872 personnes), les militaires et le personnel diplomatique en poste hors du territoire, ainsi que certains travailleurs musulmans en France.
[35] Non compris le personnel des établissements militaires.
[36] Iles Saint-Paul et Nouvelle-Amsterdam; archipels de Kerguélen et Crozet et Terre Adélie, auparavant dépendances de Madagascar.
[37] La population était estimée à 60 en 1953 et 103 en 1960; tous du sexe masculin.
[38] Département français d'outre-mer.
[39] Province d'outre-mer du Portugal.
[40] Selon le recensement de la population civilisée effectué en 1955, le total était de 117 405 (63 991 du sexe masculin, 53 414 du sexe féminin).
[41] Province africaine de l'Espagne.
[42] Iles de Fernando Poo et Annobon (recensement de 1950: population: 40 475 et 1 403 respectivement).
[43] Comprend la Guinée continentale et les îles de Corisco et Elobey (recensement de 1950: population: 156 176, 513 et 96 respectivement).

[1] For explanation of code, see page 15.
[2] Population per square kilometre of area in 1960.
[9] Appears not to be in accord with results of latest census, shown adjacent.
[41] African Province of Spain.
[44] Comprising Alhucemas, Chafarinas and Peñón de Vélez de la Gomera.
[45] Population includes nomads (estimated at 20 000 for both sexes in 1946), the population of the headquarters of administration located at Mafeking in the Republic of South Africa, and other civilian nationals working outside Territory, numbering 282 and 14 119, respectively, at 1946 census.
[46] For Colony only.
[47] Excludes allowance for seasonal immigrants ("strange farmers"), estimated at 11 372 in 1953 and 5 757 in 1959.
[48] Population excludes non-African armed forces and, at the time of census, persons in transit and Polish refugees in camps, numbering 4 137 and 188, respectively.
[49] Includes an estimate of 219 000 for both sexes for population of Northern Frontier Provinces and parts of Rift Valley only partially covered by census.
[50] Excluding data for dependencies, shown separately hereunder.
[51] Comprising Diego García, Peros Banhos, Agalega, Salomon and St. Brandon Islands.
[52] Non-indigenous population plus "Africans in employment", i.e., native employees of the European money economy.

Italique: estimations discutables.
Les chiffres en caractères gras dans les estimations indiquent qu'il s'agit de résultats de recensement.

x Estimation non officielle.
[1] Pour l'explication du code, voir page 64.
[2] Habitants par km² en 1960.
[5] Population non indigène seulement.
[22] Pour 1959.
[50] Non compris les dépendances qui font l'objet de rubriques distinctes (voir plus bas sous cette rubrique).
[53] Population non indigène (71 760 personnes) et "Africains occupant un emploi" (cf. [52]). Le sondage de la population indigène de fait, effectué le 30 juin 1950, a donné un total de 1 816 000 personnes; la population de droit correspondante était estimée à 1 837 000 personnes (895 000 du sexe masculin, 942 du sexe féminin).
[54] Population non indigène (16 435 personnes) et "Africains occupant un emploi" (cf. [52]). Le recensement de la population indigène de droit effectué de mars à juillet 1945, a donné un total de 2 178 013 personnes (1 071 147 du sexe masculin et 1 106 866 du sexe féminin).
[55] Population non indigène (190 330 personnes dont 98 399 du sexe masculin, et 91 931 du sexe féminin) et "Africains occupant un emploi" (cf. [52]). Le sondage de la population indigène de fait (enquête effectuée en 1953-1955) a donné un total de 1 477 000 personnes (658 000 du sexe masculin et 819 000 du sexe féminin). La population de droit correspondante était estimée à 2 047 000 personnes (1 023 000 du sexe masculin et 1 024 000 du sexe féminin).
[56] Population estimée à 168 en 1953 et 457 en 1960.
[57] Population estimée à 285 en 1953 et 292 en 1959.
[58] Gough, Inaccessible et Nightingale, l'île de Gough étant seule habitée.
[59] Population effectivement dénombrée; compte non tenu d'un ajustement de 8 pour 100 pour les deux sexes, destiné à compenser les lacunes du dénombrement.
[60] Non compris les militaires des forces armées non africaines et ou moment du recensement, 1 415 personnes en transit.

Italics indicate estimates of questionable reliability.
Boldface figures in estimates columns indicate that data are census results.
* Provisional.
[1] For explanation of code, see page 15.
[2] Population per square kilometre of area in 1960.
[9] Appears not to be in accord with results of latest census, shown adjacent.
[13] Population is *de jure*.
[61] Including data for Walvis Bay, which is an integral part of the Republic of South Africa but is administered as if it were part of South West Africa (area 969 km²; population 12 568 in 1960).
[62] For 1 June.
[63] *De jure* population, but distribution by sex excludes diplomatic personnel stationed outside country, numbering 84 for both sexes.
[64] For 7 August.
[65] For 1961.
[66] For 1953-61.
[67] Excluding data for Canal Zone, shown separately below.
[68] Shown elsewhere as "United States".
[69] Excludes armed forces overseas, estimated at 609 720, and civilian citizens absent from country for extended period of time estimated at 764 701.
[70] Includes armed forces overseas.
[71] Overseas Department of Denmark.
[72] Area of ice-free portion is 371 700 km².
[73] Note suppressed.

Italique: estimations discutables.
Les chiffres en caractères gras dans les estimations indiquent qu'il s'agit de résultats de recensement.
* Données provisoires.
[1] Pour l'explication du code, voir page 64.
[2] Habitants par km² en 1960.
[9] Semble ne pas être en accord avec les résultats du dernier recensement ci-joint.
[13] Population de droit.
[61] Y compris Walvis Bay, ville qui fait partie intégrante de la République sud-africaine, mais qui est administrée comme si elle relevait du Sud-Ouest africain (superficie: 969 km²; 12 568 habitants en 1960).
[62] Au 1er juin.
[63] Population de droit, mais la répartition par sexe ne tient pas compte de 84 personnes des deux sexes appartenant au personnel diplomatique en poste hors du pays.
[64] Au 7 août.
[65] Pour 1961.
[66] Pour 1953-61.
[67] Non compris la zone du Canal, qui fait l'objet d'une rubrique distincte (voir plus bas).
[68] Désigné ailleurs sous le nom d'"Etats-Unis".
[69] Non compris 609 720 militaires à l'étranger (estimation), et les civils nationaux (estimation: 764 701) absents du pays pour de longues périodes.
[70] Y compris les militaires à l'étranger.
[71] Département d'outre-mer du Danemark.
[72] La superficie non occupée par la glace est de 371 700 km².
[73] Note supprimée.

Italics indicate estimates of questionable reliability.
Boldface figures in estimates columns indicate that data are census results.
* Provisional.
ˣ Unofficial estimate.
[1] For explanation of code, see page 15.
[2] Population per square kilometre of area in 1960.
[9] Appears not to be in accord with results of latest census, shown adjacent.
[99] Except for 1953, population excludes alien armed forces, merchant seamen and foreign diplomatic personnel.
[100] *De jure* population in 252 towns only, approximating the urban area of the Union; these are the results of the first stage of a multi-stage sample census. In the second-stage enumeration carried out on 1 February 1954, an additional 2 908 001 persons were enumerated in 3 159 village tracts, 2 143 of which were in Burma proper and 1 016 in Kachin state. The last regular census of Burma was in 1941.
[101] Estimate, based on results of a demographic sample survey covering 345 villages, and supplementary administrative reports.
[102] Population excludes non-resident military and shipping personnel.
[103] Population actually enumerated; total, including 0.7 per cent adjustment for underenumeration, is 8 154 580 for both sexes.
[104] Population registered, plus estimate of 8 397 477 for persons living in outlying areas where local registration offices were not established. No adjustment has been made for 0.1 per cent estimated net underenumeration. Source: *Hsin Hua Monthly*.
[105] For 31 December 1957. Estimate revised downward by 10 million to take account of population of Taiwan erroneously included in previously published figure. Source: *Ten Great Years (Statistics of the Economic and Cultural Achievements of the People's Republic of China)*, published by the State Statistical Bureau, Peking, 1960. Semi-official estimates for 1958 range from 670 to 680 million.
[106] For 1953-57.
[107] For 31 December 1957.
[108] Comprising islands of Taiwan and Pescadores.
[109] Includes population of Quemoy and Matsu Islands.
[110] Excludes armed forces and foreigners.
[111] Excludes the Cypriot population of Base Areas (but including Akrotiri Village), ships in ports and members of the Greek and Turkish armies stationed in the Republic.
[112] Excludes armed forces.

Italique: estimations discutables.
Les chiffres en caractères gras dans les estimations indiquent qu'il s'agit de résultats de recensement.
* Données provisoires.
ˣ Estimation non officielle.
[1] Pour l'explication du code, voir page 64.
[2] Habitants par km² en 1960.
[9] Semble ne pas être en accord avec les résultats du dernier recensement ci-joint.
[99] Sauf pour 1953, les données excluent les membres des forces armées étrangères, de la marine marchande et du corps diplomatique.
[100] Population de droit de 252 villes seulement, représentant la presque totalité des zones urbaines de l'Union; résultats obtenus sur l'échantillon du premier degré d'un recensement par sondage à plusieurs degrés. Au cours des opérations du deuxième degré, effectuées le 1er février 1954 on a dénombré 2 908 001 autres personnes dans 3 159 zones de villages dont 2 143 en Birmanie proprement dite et 1 016 dans l'Etat de Kachin. En Birmanie le dernier recensement régulier a eu lieu en 1941.
[101] D'après les résultats d'une enquête démographique par sondage dans 345 villages et les données des rapports administratifs complémentaires.
[102] Non compris les militaires et les agents des compagnies de transport maritimes non résidents.
[103] Population effectivement dénombrée; après ajustement de 0.7 pour 100 pour compenser les lacunes du dénombrement, le total pour les deux sexes est de 8 154 580 habitants.
[104] Population enregistrée, augmentée d'une estimation (8 397 477 personnes) pour les régions périphériques où il n'existait pas de bureaux locaux d'enregistrement, mais compte tenu d'un ajustement de 0.1 pour 100 destiné à compenser les lacunes du dénombrement. Source: *Hsin Hua Monthly*.
[105] Au 31 décembre 1957. Un abaissement des estimations de 10 millions a été effectué pour tenir compte du chiffre de population de Taïwan inclus par erreur dans les chiffres publiés antérieurement. Source: *Ten Great Years (Statistics of the Economic and Cultural Achievements of the People's Republic of China)*, publiées par le State Statistical Bureau, Pékin, 1960. Les estimations semi-officielles de 1958 variaient de 670 à 680 millions.
[106] Pour 1953-57.
[107] Au 31 décembre 1957.
[108] Taïwan et les Pescadores.
[109] Y compris la population des îles Quemoy et Matsu.
[110] Non compris les militaires et les étrangers.
[111] Non compris la population chypriote des bases (mais y compris celle du village d'Akrotiri), les équipages des navires dans les ports et les membres des forces armées grecque et turque, en garnison dans la République.
[112] Non compris les militaires.

[2] Population per square kilometre of area in 1960.
[9] Appears not to be in accord with results of latest census, shown adjacent.
[13] Population is *de jure*.
[65] For 1961.
[66] For 1953-61.
[113] Comprising Perak, Selangor, Negri Sembilan and Pahang (the former Federated Malay States), Kedah, Perlis, Kelantan, Trengganu and Johore (the former Unfederated Malay States), and Penang with Province Wellesley and Malacca (the former Colony of the Straits Settlements). Population excludes transients afloat.
[114] Including Andaman, Nicobar, Laccadive, Minicoy and Amindivi Islands; excluding Kashmir-Jammu, the final status of which has not yet been determined (population 3 583 585 at 1961 census, area 222 801 km²).
[115] Population for both sexes includes estimates of 369 000 for Nagaland and 450 000 for North East Frontier Agency where the enumeration has not yet been completed, but for male and female they are excluded. Male and female figures also exclude data for Pondichery, Karikal, Mahe and Yanaon, together numbering 369 083 for both sexes.
[116] Includes population of Kashmir-Jammu, the final status of which has not yet been determined, and Sikkim, but excludes population of Nagaland and North East Frontier Agency.
[117] Excluding armed forces and police, and their dependants living in camps.
[118] Population actually enumerated, including nationals abroad; total, including adjustment of 221 066 for underenumeration (124 632 male, 96 434 female), is 6 538 109 for both sexes.
[119] Comprising Hokkaido, Honshu, Shikoku, Kyushu, the Amami Islands, and the Tokara Archipelago. Population excludes diplomatic personnel outside country and allied military and civilian personnel and their dependants stationed in the area.
[120] Excludes Amami Islands, acquired from Ryukyu Islands on 25 December 1953 (population, 205 363 in 1955).
[121] Excludes military personnel and their dependents living in military installations, and foreigners, except registered Palestinian refugees (numbering 475 620 on 30 June 1953 and 630 725 on 30 June 1961), who are included.
[122] Source: United Nations Economic Commission for Asia and the Far East.
[123] Population excludes alien armed forces, civilian aliens employed by armed forces, and foreign diplomatic personnel and their dependants.

Italique: estimations discutables.
* Données provisoires.
x Estimation non officielle.
[1] Pour l'explication du code, voir page 64.
[2] Habitants par km² en 1960.
[9] Semble ne pas être en accord avec les résultats du dernier recensement ci-joint.
[13] Population de droit.
[65] Pour 1961.
[66] Pour 1953-61.
[113] Perak, Selangor, Negri Sembilan et Pahang (anciens Etats malais fédérés), Kedah, Perlis, Kelantan, Trengganu et Johore (anciens Etats malais non fédérés) et Penang avec la province de Wellesley et Malacca (ancienne colonie des Etablissements des détroits). Non compris les personnes de passage à bord des navires.
[114] Andaman, Nicobar, les îles Laquedives, Minicoï et Amindivi; non compris le Cachemire-Jammu, dont le statut définitif n'a pas encore été déterminé (au recensement de 1961 la population était de 3 583 585 habitants; superficie: 222 801 km²).
[115] La population des deux sexes, estimée à 369 000 pour Nagaland et 450 000 pour l'Agence frontalière nord-est dont le dénombrement n'est pas complet, est comprise dans la population totale, mais n'est pas comprise dans la population "masculine" et la population "féminine". Pour Pondichéry, Karikal, Mahé et Yanaon dont le chiffre est de 369 083 pour les deux sexes, la population "masculine" et la population "féminine" ne sont pas comprises.
[116] Y compris la population du Cachemire-Jammu, dont le statut définitif n'a pas encore été déterminé, et Sikkim, mais non compris la population de Nagaland et de l'Agence frontalière nord-est.
[117] Non compris les forces armées et les forces de police et les membres de leur famille vivant dans des camps.
[118] Population effectivement dénombrée qui comprend les nationaux à l'étranger; le total, après ajustement de 221 066 unités pour compenser les lacunes du dénombrement (124 632 pour le sexe masculin et 96 434 pour le sexe féminin), est de 6 538 109 pour les deux sexes.
[119] Hokkaïdo, Honshu, Shikoku, Kyu-shu, les îles Amami, et l'archipel des Tokara. Non compris le personnel du corps diplomatique hors du territoire, les militaires et civils alliés en poste sur le territoire et les membres de leurs familles les accompagnant.
[120] Non compris les îles Amami, cédées par les îles Ryû-kyû le 25 décembre 1953 (population en 1955, 205 363 personnes).
[121] Non compris les militaires et leurs familles vivant dans des installations militaires et les étrangers exceptés les réfugiés de Palestine immatriculés, au nombre de 475 620 au 30 juin 1953 et 630 725 au 30 juin 1961.
[122] Source: Commission économique des Nations Unies pour l'Asie et l'Extrême-Orient.
[123] Non compris les militaires étrangers, les civils étrangers employés par les forces armées et le personnel diplomatique étranger et les membres de leur famille les accompagnant.

Italics indicate estimates of questionable reliability.
Boldface figures in estimates columns indicate that data are census results.
* Provisional.
x Unofficial estimate.
[1] For explanation of code, see page 15.
[2] Population per square kilometre of area in 1960.
[9] Appears not to be in accord with results of latest census, shown adjacent.
[39] Overseas Province of Portugal.
[112] Excludes armed forces.
[137] Western end of island of New Guinea. There is a dispute about the territory, as regards its political status, between the Government of Indonesia and the Government of the Netherlands.
[138] Comprising Macau City and Islands of Taipa and Coloane.
[138a] Excludes population of *concelho* of Nagar-Aveli, numbering 41 532 at 1950 census.
[139] Comprising the Colony of Aden (which includes Perim), the Protectorate (Eastern and Western), and dependencies, i.e., Kamaran Island, Kuria Muria Islands and Socotra.
[140] Excluding data for Perim, Kamaran Island and Kuria Muria Islands; including data for port and military personnel.
[141] Excludes schedules not tabulated by sex, numbering 1 775 for both sexes.
[142] Comprising Hong Kong Island, Kowloon and the New (leased) Territories.
[143] Land area only. Total area including inland water is 2 916 km².
[144] Population excludes transients afloat and non-locally domiciled military and civilian services personnel and their dependants, numbering 3 466 and 27 299, respectively, at 1957 census.

Italique: estimations discutables.
Les chiffres en caractères gras dans les estimations indiquent qu'il s'agit de résultats de recensement.
* Données provisoires.
x Estimation non officielle.
[1] Pour l'explication du code, voir page 64.
[2] Habitants par km² en 1960.
[9] Semble ne pas être en accord avec les résultats du dernier recensement ci-joint.
[39] Province d'outre-mer du Portugal.
[112] Non compris les militaires.
[137] Extrémité occidentale de l'île de la Nouvelle-Guinée. Le statut politique du territoire fait l'objet d'un différend entre les gouvernements indonésien et néerlandais.
[138] Ville de Macao et les îles de Taïpa et de Colowane.
[138a] Non compris la population du *concelho* de Nagar-Aveli au nombre de 41 532 lors du recensement de 1950.
[139] La Colonie d'Aden et Périm ainsi que le Protectorat (partie occidentale et partie orientale) et ses dépendances; île de Kamaran, îles de Kuria Muria et Socotra.
[140] Non compris Périm, l'île de Kamaran, les îles de Kuria Muria; il est tenu compte du personnel du port d'Aden et des militaires.
[141] Compte non tenu des bulletins qui n'ont pas été classés par sexe, soit 1 775 bulletins pour les deux sexes.
[142] Ile de Hong-kong, Kowloon et les Nouveaux Territoires (à bail).
[143] Superficie terrestre seulement; la superficie totale est de 2 916 km² y compris les eaux intérieures.
[144] Non compris les personnes de passage à bord des navires, ni les militaires et agents civils domiciliés en dehors du territoire et les membres de leurs familles les accompagnant, soit respectivement 3 466 et 27 299 personnes lors du recensement de 1957.

[2] Population per square kilometre of area in 1960.
[9] Appears not to be in accord with results of latest census, shown adjacent.
[13] Population is *de jure*.
[145] Excludes Bedouin population, numbering 66 553 for both sexes.
[146] Comprising that part of Palestine under Egyptian administration following the Armistice of 1949.
[147] Comprising Parry, Beechey, Bailey, Volcano and Marcus Islands.
[148] Population excludes Allied military and civilian personnel and their dependants stationed in the area.
[149] Population numbered 154 in 1953 and 204 in 1960.
[150] Comprising those islands of the Ryukyu group south of the 29th degree of North latitude, except the Tokara Archipelago and Amami Islands, which reverted to Japan on 5 December 1951 and 25 December 1953, respectively.
[151] Excludes area of frontier rivers.
[152] Excluding Faeroe Islands and the Overseas Department of Greenland, shown separately.
[153] Based on 17 per cent sample of census returns.
[154] Includes Finnish nationals temporarily outside country.
[155] Metropolitan (continental) France only.
[156] Excludes alien armed forces, members of foreign diplomatic service in country, French diplomatic service outside country and career military service outside country except those on duty in Germany or Austria. Includes civilian residents temporarily outside country, military conscripts wherever stationed and all personnel on duty in Germany or Austria and their dependants, the three latter estimated at 186 500 in 1954.

Italique: estimations discutables.
Les chiffres en caractères gras dans les estimations indiquent qu'il s'agit de résultats de recensement.

x Estimation non officielle.
[1] Pour l'explication du code, voir page 64.
[2] Habitants par km² en 1960.
[9] Semble ne pas être en accord avec les résultats du dernier recensement ci-joint.
[13] Population de droit.
[145] Non compris la population bédouine au nombre de 66 553 personnes des deux sexes.
[146] Partie de la Palestine administrée par l'Egypte à la suite de l'armistice de 1949.
[147] Iles Parry, Beechey, Bailey, Volcan et Marcus.
[148] Non compris les membres des forces militaires alliées, le personnel civil et les membres de leurs familles les accompagnant, en garnison sur le territoire.
[149] 1953: 154 habitants; 1960: 204 habitants.
[150] Y compris le groupe des îles Ryû-kyû situées au sud du 29ème parallèle (latitude nord), à l'exclusion de l'archipel des Tokara et des îles Amami, rattachés au Japon le 5 décembre 1951 et le 25 décembre 1953 respectivement.
[151] Non compris la surface des cours d'eau frontières.
[152] Non compris les îles Féroé et le département d'outre-mer du Groenland qui font l'objet de rubriques distinctes.
[153] D'après 17 pour 100 des estimations d'un recensement par sondage.
[154] Y compris les nationaux finlandais temporairement hors du pays.
[155] France métropolitaine (continentale) seulement.
[156] Non compris les militaires et le personnel diplomatique étranger dans le pays, le personnel diplomatique français en poste à l'étranger, et les militaires de carrière hors du pays, à l'exception de ceux des troupes d'occupation en Allemagne et en Autriche. Y compris les résidents civils temporairement hors du pays, les militaires du contingent où qu'ils se trouvent ainsi que tous les civils et militaires en occupation en Allemagne et en Autriche avec les membres des leurs familles les accompagnant, soit au total 186 500 personnes en 1954.

* Provisional.
ˣ Unofficial estimate.
[1] For explanation of code, see page 15.
[2] Population per square kilometre of area in 1960.
[13] Population is *de jure*.
[30] Reason for discrepancy between this figure and sum of frequencies shown for male and female is rounding of figures for the latter.
[157] Results of a census of housing which enumerated individuals separately.
[158] Based on estimates of 1 January rather than midyear because latter is atypical in 1953.
[159] Includes armed forces stationed outside country but excludes alien armed forces stationed in the area.
[160] Area is 0.44 km².
[161] Land area only; revised figure based on statistics of land utilization.
[162] Excluding civilian aliens within country and, except for 1953, including civilian nationals temporarily outside country.
[163] Continental Portugal, which includes the Azores and Madeira Islands.
[164] Continental Spain, which includes the Balearic and Canary Islands.

Italique: estimations discutables.
Les chiffres en caractères gras dans les estimations indiquent qu'il s'agit de résultats de recensement.
* Données provisoires.
ˣ Estimation non officielle.
[1] Pour l'explication du code, voir page 64.
[2] Habitants par km² en 1960.
[13] Population de droit.
[30] La différence entre ce chiffre et le total des chiffres de la population du sexe masculin et du sexe féminin s'explique par l'arrondissement du chiffre de la population féminine.
[157] Résultats d'un recensement de l'habitation au cours duquel il a été procédé à un dénombrement des personnes séparément.
[158] D'après des estimations établies pour le 1er janvier et non pour le milieu de l'année, car dans ce dernier cas les données n'auraient pas été représentatives pour 1953.
[159] Y compris les militaires nationaux hors du pays, mais non compris les militaires étrangers en garnison sur le territoire.
[160] Superficie: 0.44 km².
[161] Superficie terrestre seulement; les chiffres revisés sont basés sur les statistiques de l'utilisation des terres.
[162] Non compris le personnel civil étranger dans le pays, mais, sauf en 1953, y compris le personnel civil étranger temporairement hors du territoire.
[163] Portugal continental, y compris les Açores et Madère.
[164] Espagne continentale, y compris les Baléares et les Canaries.

1. Area, density, population by sex and rate of increase (continued) — Superficie, densité, population selon le sexe et taux d'accroissement (suite)

[165] Shown elsewhere as "United Kingdom" and excluding Channel Islands and Isle of Man, shown separately below.
[166] Excludes armed forces and diplomatic personnel outside the country but includes other Commonwealth and alien armed forces and foreign diplomatic personnel within the country.
[167] Includes armed forces stationed outside country, but excludes other Commonwealth and alien armed forces stationed in the area.
[168] Inhabited only during winter season. Estimates are for Norwegian population only and are included also in *de jure* population of Norway.
[169] Including data for dependencies: Alderney, Brechou, Great Sark, Little Sark, Herm, Jethou and Lihou Islands.

Les chiffres en caractères gras dans les estimations indiquent qu'il s'agit de résultats de recensement.
* Données provisoires.
x Estimation non officielle.
[1] Pour l'explication du code, voir page 64.
[2] Habitants par km² en 1960.
[9] Semble ne pas être en accord avec les résultats du dernier recensement ci-joint.
[13] Population de droit.
[30] La différence entre ce chiffre et le total des chiffres de la population du sexe masculin et du sexe féminin s'explique par l'arrondissement du chiffre de la population féminine.
[65] Pour 1961.
[66] Pour 1953-61.
[165] Désigné ailleurs sours le nom de "Royaume-Uni"; non compris les îles Anglo-Normandes et l'île de Man qui font l'objet de rubriques distinctes (voir plus bas).
[166] Non compris les membres des forces armées et le personnel diplomatique hors du territoire, mais y compris les autres membres du Commonwealth et les militaires étrangers en garnison et les membres du personnel diplomatique.
[167] Y compris les forces armées en garnison hors du pays, mais non compris les militaires du Commonwealth et les forces armées étrangères en garnison sur le territoire.
[168] Régions habitées seulement en hiver. Ces estimations ne se rapportent qu'à la population norvégienne et sont également comprises dans le chiffre de la population de droit de la Norvège.
[169] Y compris les données pour les dépendances: Aurigny, Brecqhou, Grand-Sercq, Petit-Sercq, Herm, Jethou et Lihou.

1. Area, density, population by sex and rate of increase (continued) — Superficie, densité, population selon le sexe et taux d'accroissement (suite)

Italics indicate estimates of questionable reliability.
* Provisional.
[1] For explanation of code, see page 15.
[2] Population per square kilometre of area in 1960.
[5] For non-indigenous population only.
[9] Appears not to be in accord with results of latest census, shown adjacent.
[13] Population is *de jure*.
[112] Excluding armed forces.
[170] Excludes persons accommodated in harbour shipping, numbering 427 for both sexes.
[170a] Lack of accord with resulting latest census, shown adjacent, due to fact that estimates are based on population register, which includes persons not present in the area at the time of the census.
[171] Including data for Comino Island. Population excludes non-Maltese armed forces stationed in the area but, for 1957 and 1960, includes civilian nationals temporarily outside country.
[172] Population excludes full-blooded aborigines estimated at 39 319 in June 1954, and armed forces stationed outside country, numbering 48 106 in May 1959.
[173] Including Campbell and Kermadec Islands (population 20 in 1961, area 148 km².), as well as Antipodes, Auckland, Bounty, Snares, Solander and Three Kings Islands, all of which are uninhabited. Population excludes armed forces outside country, numbering 2 559 at 1961 census.
[174] Excludes transients afloat and non-locally domiciled military and civilian services personnel and their dependants.
[175] Southeastern part of the island of New Guinea.
[176] Comprising Austral, Gambier, Marquesas, Rapa, Society and Tuamotu Islands.
[177] Including data for dependencies: Wallis, Futuna, Huon and Chesterfield Islands.

Italique: estimations discutables.
* Données provisoires.
[1] Pour l'explication du code, voir page 64.
[2] Habitants par km² en 1960.
[5] Population non indigène seulement.
[9] Semble ne pas être en accord avec les résultats du dernier recensement ci-joint.
[13] Population de droit.
[112] Non compris les militaires.
[170] Non compris les personnes logées à bord des navires du port, au nombre de 427 pour les deux sexes.
[170a] Le manque d'accord avec les résultats du dernier recensement qui figurent sur la même ligne est dû au fait que les estimations sont établies d'après le registre de la population; dans ce registre sont inscrites des personnes qui n'étaient pas présentes au moment du recensement, dans la superficie recensée.
[171] Y compris l'île de Comino. Non compris les militaires non maltais en garnison sur le territoire. Y compris pour 1957 et 1960, les civils nationaux temporairement hors du territoire.
[172] Non compris les aborigènes purs, au nombre de 39 319 en juin 1954 (estimation), ni les militaires hors du territoire (48 106 en mai 1959).
[173] Y compris les îles Campbell et Kermadec (148 km², population de 20 habitants en 1961) ainsi que les îles Antipodes, Auckland, Bounty, Snares, Solander et Three Kings qui sont toutes inhabitées. Il n'est pas tenu compte des militaires hors du pays, au nombre de 2 559 lors du recensement de 1961.
[174] Non compris les personnes de passage à bord de navires, ni les militaires et les fonctionnaires civils domiciliés en dehors du territoire et les membres de leur famille les accompagnant.
[176] C'est-à-dire les îles Australes, Gambier, Marquises, Rapa, de la Société et Touamotou.
[177] Y compris les dépendances: îles Wallis, Futuna, Huon et Chesterfield.

[1] Comprising land area and inland waters, but excluding uninhabited polar regions and some uninhabited islands.
[2] Adjusted for underenumeration and errors in estimation.
[3] Population per square kilometre of area.
[4] Hawaii, though a state of the United States of America, is included in Oceania.
[5] Rate reflects combined effects of natural increase and migration.
[6] Weighted average of recorded rates.
[7] Excluding the Union of Soviet Socialist Republics shown separately below. Including Asiatic Turkey.
[8] Excluding the Union of Soviet Socialist Republics shown separately below. Including European Turkey.

[1] Superficie des terres et des eaux intérieures, non compris les zones polaires ni quelques îles inhabitées.
[2] Chiffres ajustés pour tenir compte des lacunes de certains dénombrements et des erreurs d'estimation.
[3] Nombre d'habitants par kilomètre carré.
[4] Hawaii, bien qu'Etat des Etats-Unis d'Amérique, est rattaché à l'Océanie.
[5] Taux correspondant aux effets combinés de l'accroissement naturel et de la migration.
[6] Moyenne pondérée de taux calculés à partir des données d'enregistrement.
[7] Non compris l'Union des Républiques socialistes soviétiques qui fait l'objet d'une rubrique distincte (voir plus bas). Y compris la Turquie d'Asie.
[8] Non compris l'Union des Républiques socialistes soviétiques qui fait l'objet d'une rubrique distincte (voir plus bas). Y compris la Turquie d'Europe.

3. Vital statistics summary : selected countries latest available year
Aperçu du mouvement de la population : quelques pays, dernière année pour laquelle on possède des données

[Countries and territories included are those reporting complete registration of births and deaths and those for which a relatively accurate estimate of the national birth and death rate is available. Italics (used only for other than birth and death rates) indicate that data are unreliable (incomplete) or of unknown completeness. Crude marriage, divorce, birth, death and natural increase rates are computed per 1 000 population; infant mortality rates are per 1 000 live births and fertility rates per 1 000 female population aged 10-49 years. Expectation of life is the average number of years of life remaining at birth. For method of evaluation and limitations of data, see Technical Notes, page 24. For more precise information in terms of coverage, basis of tabulation, etc., see corresponding trend tables 6, 12, 14, 24, 27 and 29.—Les pays et territoires retenus sont ceux où l'enregistrement des naissances et des décès est complet où pour lesquels il existe une estimation relativement exacte du taux de natalité et du taux de mortalité correspondants. Exception faite des taux de natalité et de mortalité, les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Les taux bruts de nuptialité, de divortialité, de natalité, de mortalité et d'accroissement naturel sont calculés pour 1 000 habitants; les taux de mortalité infantile sont calculés pour 1 000 naissances vivantes et les taux de fécondité pour 1 000 femmes âgées de 10 à 49 ans. L'espérance de vie représente le nombre moyen d'années restant à vivre à la naissance. Pour la méthode d'évaluation et les insuffisances des données, voir Notes Techniques, page 74. Pour plus de détails sur la portée, la base d'exploitation des données, etc., voir les tableaux correspondants de l'évolution de la population (tableaux 6, 12, 14, 24, 27 et 29).]

Italics: Data are unreliable or of unknown completeness.
[1] Data are estimates based on results of sample surveys.
[2] For 1950.
[3] For 1959.
[4] Data are estimates based on results of demographic sample survey(s) of African population.
[4a] Computed on female population aged 15-45 rather than 10-49 years.
[5] Data are estimates based on results of May-September 1961 demographic sample survey.
[6] Rates are for a compulsory registration area of 36 towns and townships which comprises about 12 per cent of total population and is not representative of Ghana.
[7] Probably estimated from 1948 census returns for African population.
[8] Data are estimates, based on results of 1955 demographic sample survey of residents.
[9] Computed on female population aged 14-49 rather than 10-49 years.
[10] For rural population only; corresponding data for urban population are 190 for infant mortality and 35.8 years for life expectancy.
[11] For 1956. Data are estimates for indigenous rural population, based on results of 1956-58 demographic sample survey of 69 villages.
[12] Estimated rates based on incomplete provisional results of June 1960-May 1961 demographic sample survey.
[13] For 1952.
[14] Estimated rate, basis unknown.
[15] For 1956.
[16] For 1958.
[17] Note suppressed.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
[1] Taux estimatifs obtenus à partir des résultats d'enquêtes par sondage.
[2] Pour 1950.
[3] Pour 1959.
[4] Taux estimatifs obtenus à partir des résultats d'enquêtes démographiques par sondage concernant la population africaine.
[4a] Taux calculé sur la base de l'effectif de la population féminine âgée de 15 à 45 ans et non de 10 à 49 ans.
[5] Taux estimatifs obtenus à partir des résultats de l'enquête démographique par sondage de mai-septembre 1961.
[6] Taux se rapportant à une zone où l'enregistrement est obligatoire; cette zone se compose de 36 villes et municipalités comptant 12 pour 100 environ de la population totale et n'est pas représentative de l'ensemble du Ghana.
[7] Valeur probablement estimée d'après les bulletins du recensement de la population africaine effectué en 1948.
[8] Taux estimatifs obtenus à partir des résultats de l'enquête démographique par sondage de 1955 sur les résidents.
[9] Taux calculé sur la base de l'effectif de la population féminine âgée de 14 à 49 ans et non de 10 à 49 ans.
[10] Population rurale seulement; pour la population urbaine, les données correspondantes s'établissent comme suit: taux de mortalité infantile 190; espérance de vie 35,8 ans.
[11] Pour 1956. Taux estimatifs concernant la population indigène rurale; ces taux ont été obtenus à partir des résultats de l'enquête démographique par sondage effectuée en 1956-58 dans 69 villages.
[12] Taux estimatifs obtenus à partir des résultats provisoires incomplets de l'enquête démographique par sondage de juin 1960-mai 1961.
[13] Pour 1952.
[14] Taux estimatif; base inconnue.
[15] Pour 1956.
[16] Pour 1958.
[17] Note supprimée.

Italics: Data are unreliable or of unknown completeness.
** Rates based on frequencies of less than 15.
[3] For 1959.
[15] For 1956.
[16] For 1958.
[25] For 1953.
[27] For 1960.
[32] For 1951.
[34] For 1957.
[35] There is no provision for "divorce" in sense used here.
[40] Estimated rate for rural India obtained from 14th round of National Sample Survey. Rates for all India estimated from 1941-1951 census returns were 39.9 for births, 27.4 for deaths and 185 for infant deaths.
[41] Estimated rates; basis unknown. Birth rate is "40 or over", death rate is "less than 20" and natural increase rate is "20 and over".
[42] For 1961.
[43] Estimated rate, based on demographic analysis of results of 1956 census of population and subsequent national sample survey in 40 towns and 300 villages.
[44] Estimated rates, based on demographic analysis of 1952-54 population census returns.
[45] Estimated average annual rate for 1947-56, based on demographic analysis of results of 1947 population census and 1956 Demographic and Economic Survey of Thailand.
[46] For 1958, computed on female population aged 10-44 years rather than 10-49 years.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
** Taux calculés à partir de fréquences inférieures à 15.
[3] Pour 1959.
[15] Pour 1956.
[16] Pour 1958.
[25] Pour 1953.
[27] Pour 1960.
[32] Pour 1951.
[34] Pour 1957.
[35] Il n'existe pas de dispositions législatives touchant le "divorce" au sens où on l'entend ici.
[40] Taux estimatif concernant la population rurale de l'Inde; ce taux a été obtenu à partir des résultats de la 14ème phase de l'Enquête nationale par sondage. Pour l'ensemble de l'Inde, les taux estimatifs de natalité et de mortalité infantile, calculés sur la base des résultats des recensements de 1941 et de 1951, s'établissent respectivement à 27,4 et 185.
[41] Taux estimatifs; base inconnue. Le taux de natalité est égal à "40 ou plus", celui de mortalité à "moins de 20" et celui d'accroissement naturel à "20 et plus".
[42] Pour 1961.
[43] Taux estimatif établi à partir des résultats de l'analyse démographique du recensement de population de 1956 et d'une enquête nationale par sondage effectuée plus tard dans 40 villes et 300 villages.
[44] Taux estimatifs établis à partir des résultats de l'analyse démographique du recensement de la population effectué en 1952-54.
[45] Taux annuel moyen estimatif pour 1947-56; ce taux a été calculé d'après une analyse démographique des résultats du recensement de la population de 1947 et de l'Enquête thaïlandaise démographique et économique de 1956.
[46] Pour 1958. Taux calculé sur la base de l'effectif de la population féminine âgée de 10 à 44 ans et non de 10 à 49 ans.

4. Estimates of midyear population : 1941-1961

[Unless otherwise indicated, data are official estimates of population for 1 July, or averages of end-year estimates. Figures shown in boldface are census results relating to date of enumeration. Figures shown in italics are estimates of questionable reliability, evaluated according to method of their construction; for components of 1960 estimates, see Table 1. For explanation of method of construction of 1960 estimates and of method of evaluation, see Technical Notes, page 25.]

Italics indicate estimates of questionable reliability.
Boldface indicates that data are census results.
* Provisional.
§ Estimates appear not to be in accord with results of latest census.
| Vertical bar indicates marked break in series.
[1] Including the two Departments of the Sahara.
[2] Among European population, excludes personnel in military establishments.
[3] Including nomad population, estimated at 20 000 in 1946, the population of the headquarters of administration located at Mafeking in South Africa, and other civilian nationals working outside Territory, numbering 282 and 14 119, respectively, at 1946 census.
[4] For African population only.
[5] Prior to 1953, excluding data for Southern Cameroons, which was formerly a part of United Nations Trust Territory of the Cameroons under British Administration and which became part of the Republic of Cameroun on 1 October 1961.
[6] For indigenous population only.
[6a] Based on results of demographic sample survey of indigenous population.
[7] Prior to 1951, excluding Asiatic and Coloured (mixed) population.
[7a] Based on results of May-September 1961 demographic sample survey.
[7b] Based on results of 1960-61 demographic sample survey of indigenous population.

Italique : Estimations de qualité douteuse.
Caractères gras : Les données proviennent de recensements.
* Données provisoires.
§ Les estimations ne concordent pas avec les résultats du dernier recensement.
| Un filet vertical indique une solution de continuité dans la série.
[1] Y compris les deux départements du Sahara.
[2] Pour la population européenne, non compris les militaires dans les établissements militaires.
[3] Y compris la population nomade (estimée à 20 000 personnes en 1946), la population du centre administratif de Mafeking (Afrique du Sud) et les autres civils nationaux travaillant hors du territoire, soit respectivement 282 et 14 119 personnes au recensement de 1946.
[4] Population africaine seulement.
[5] Pour les années antérieures à 1953, non compris le Cameroun méridional qui faisait précédemment partie du Territoire sous tutelle du Cameroun sous administration britannique et qui est devenu partie intégrante de la République du Cameroun le 1er octobre 1961.
[6] Population indigène seulement.
[6a] Etabli d'après les résultats de l'enquête démographique par sondage effectuée sur la population indigène.
[7] Pour les années antérieures à 1951, non compris les personnes d'origine asiatique et les personnes de couleur (métis).
[7a] Etabli d'après les résultats de l'enquête démographique par sondage effectuée en mai-septembre 1961.
[7b] Etabli d'après les résultats de l'enquête démographique par sondage de 1960-61 effectuée sur la population indigène.

4. Estimations de la population au milieu de l'année : 1941-1961

[Sauf indication contraire, estimations officielles au 1er juillet ou moyennes d'estimations officielles de fin d'année. Les chiffres en caractères gras proviennent de recensements et se rapportent à la population à la date du dénombrement. Les chiffres en italique sont des estimations discutables, dont la qualité est déterminée par la méthode qui a servi à les établir; pour les éléments entrant en ligne de compte dans les estimations de 1960, se reporter au tableau 1. Pour la méthode utilisée afin d'établir les estimations de 1960 et la méthode d'évaluation, voir Notes Techniques, page 75.]

[8] Excluding seasonal immigrants ("strange farmers"), numbering for 1946-1959, 13 263, 14 662, 10 863, 10 981, 16 512, 15 042, 19 720, 11 372, 12 303, 9 648, 9 218, 10 286, 9 015 and 5 757, respectively.
[9] Based on results of demographic sample survey in March, and not in accord with estimates for other years obtained from annual administrative reports.
[10] Excluding non-African armed forces.
[11] Excluding alien armed forces stationed in the area.
[12] Prior to 1956, excluding southern part of Northern Zone (former Spanish Protectorate), the transfer of which to Morocco was agreed upon 10 April 1958.
[13] For 31 August.
[14] Comprises provisional results of 1959-1960 demographic sample survey of 399 villages and an estimate for the city of Niamey, the *cercle* of Agadez, the nomad subdivision of Tahona, the northern part of the *cercles* of Goure, Zinder and N'Guigni, which were not surveyed during this inquiry.
[15] Prior to 1953, excluding Northern Cameroons, formerly part of United Nations Trust Territory of the Cameroons under British Administration, which became a province in the Northern Region of Nigeria on 1 June 1961.
[16] For 31 March.
[17] Based on results of 1960-1961 sample survey.

[8] Non compris les émigrants saisonniers (travailleurs agricoles venant d'autres régions—Strange farmers) dont le nombre, pour les années 1946-1959, s'établit comme suit : 13 263; 14 662; 10 863; 10 981; 16 512; 15 042; 19 720; 11 372; 12 303; 9 648; 9 218; 10 286; 9 015 et 5 757 respectivement.
[9] Etabli sur la base des résultats d'une enquête démographique par sondage effectuée en mars; ne correspond pas aux estimations obtenues pour d'autres années à partir des rapports administratifs annuels.
[10] Non compris les militaires non africains.
[11] Non compris les militaires étrangers en garnison sur le territoire.
[12] Pour les années antérieures à 1956, non compris la partie sud de la zone du Nord (ancien protectorat espagnol) dont le transfert au Maroc a été décidé le 10 avril 1958.
[13] Au 31 août.
[14] Calculé sur la base des résultats provisoires de l'enquête démographique par sondage effectuée en 1959-1960 dans 399 villages et d'une estimation établie pour la ville de Niamey, le cercle d'Agadès, la subdivision nomade de Tahona, la partie nord des cercles de Gouré, Zinder et N'Guigmi sur lesquels l'enquête n'a pas porté.
[15] Pour les années antérieures à 1953, non compris le Cameroun septentrional qui faisait précédemment partie du Territoire sous tutelle du Cameroun sous administration britannique et qui est devenu une province de la Région du Nord de la Nigéria le 1er juin 1961.
[16] Au 31 mars.
[17] D'après les résultats de l'enquête par sondage de 1960-1961.

Italics indicate estimates of questionable reliability.
Boldface indicates that data are census results.
* Provisional.
§ Estimates appear not to be in accord with results of latest census.
| Vertical bar indicates marked break in series.
[10] Excluding non-African armed forces.
[16] For 31 March.
[18] Prior to 31 May 1961, known as Union of South Africa. Excluding population of Walvis Bay (numbering 2 270 in 1946, 3 329 in 1951, and 12 568 in 1960), which is an integral part of South Africa but is administered as if it were part of South West Africa.
[19] During war years, including armed forces outside country (approximately 32 000 in 1941) and excluding enemy prisoners of war numbering for 1941-1946, 57 067, 72 451, 66 227, 39 139, 28 255 and 27 898, respectively.
[20] Including population of Walvis Bay (2 270 in 1946, 3 329 in 1951 and *12 568 in 1960), which is an integral part of South Africa but is administered as if it were part of South West Africa.
[21] Prior to 1950, excluding population of Alhucemas, Chafarinas and Peñón de Véles de la Gomera, totalling 472 in 1940 and 184 in 1950.
[22] *De jure* population.
[23] Includes civilian nationals temporarily employed outside country, but excludes some aliens within country.
[24] Formerly a United Nations Trust Territory under British administration; declared independent 9 December 1961.

Italique : Estimations de qualité douteuse.
Caractères gras : Les données proviennent de recensements.
* Données provisoires.
§ Les estimations ne concordent pas avec les résultats du dernier recensement.
| Un filet vertical indique une solution de continuité dans la série.
[10] Non compris les militaires non africains.
[16] Au 31 mars.
[18] Antérieurement au 31 mai 1961, connue sous le non d'Union sud-africaine. Non compris Walvis Bay (2 270 personnes en 1946, 3 329 en 1951 et 12 568 en 1960), ville qui fait partie intégrante de l'Afrique du Sud mais qui est administrée comme si elle relevait du Sud-Ouest africain.
[19] Pour les années de guerre, y compris les militaires hors du pays (environ 32 000 en 1941) et non compris les prisonniers de guerre ennemis dont le nombre, pour chacune des années 1941-1946, s'établit comme suit : 57 067, 72 451, 66 227, 39 139, 28 255 et 27 898 respectivement.
[20] Y compris Walvis Bay (2 270 personnes en 1946, 3 329 en 1951 et 12 568 en 1960), ville qui fait partie intégrante de l'Afrique du Sud mais qui est administrée comme si elle relevait du Sud-Ouest africain.
[21] Pour les années antérieures à 1950, non compris Alhucemas, les îles Zaffarines et le Peñon de Vélez de la Gomera, qui comptaient 472 habitants en 1940 et 184 en 1950.
[22] Population de droit.
[23] Y compris les civils nationaux travaillant temporairement hors du pays, mais non compris certains étrangers dans le pays.
[24] Ancien Territoire sous tutelle sous administration britannique; proclamé indépendant le 9 décembre 1961.

[25] Excluding Algerian refugees temporarily in the country, estimated at about 180 000 in 1959.

[26] Between 21 February 1958 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only; the former Syrian Region, which seceded on that date, appears as "Syria" under Asia. Data are for the former Egyptian Region.

[27] Excluding alien armed forces stationed in the area, enemy prisoners of war and nomad population, the latter numbering 55 073 at 1947 census.

[28] Excludes tourists.

[29] Excluding tourists and members of United Kingdom and United States armed forces and their dependants stationed in the area.

[30] Estimates are for 1 June.

[31] De jure population, but including armed forces stationed in the area.

[32] For indigenous population only, representing approximately 98 per cent of the total.

[33] Estimates are for 7 August.

[34] Revised to take into account partial returns of 1960 census.

[35] Excluding population of Canal Zone, shown separately above.

[36] For May.

[25] Non compris des réfugiés algériens temporairement dans le pays, estimés à 180 000 en 1959.

[26] 21 février 1958–29 septembre 1961 : Région égyptienne et Région syrienne. A partir du 29 septembre 1961, ancienne Région égyptienne seulement, l'ancienne Région syrienne ayant fait sécession à cette date, les données pertinentes figurent en regard de la rubrique "Syrie", sous la rubrique générale "Asie". Les données se rapportent à l'ancienne Région égyptienne.

[27] Non compris les militaires étrangers en garnison sur le territoire et les prisonniers de guerre ennemis, ni les nomades au nombre de 55 073 lors du recensement de 1947.

[28] Non compris les touristes.

[29] Non compris les touristes, les militaires du Royaume-Uni et des Etats-Unis en garnison sur le territoire et les membres de leurs familles les accompagnant.

[30] Estimations au 1er juin.

[31] Population de droit, mais y compris les militaires en garnison sur le territoire.

[32] Population indigène seulement, soit 98 pour cent environ de la population totale.

[33] Estimations au 7 août.

[34] Chiffre revisé pour tenir compte des résultats partiels du recensement de 1960.

[35] Non compris la Zone du Canal qui fait l'objet d'une rubrique distincte (voir plus haut).

[36] En mai.

4. Estimates of midyear population (continued)

[See note at head of table.]

Italics indicate estimates of questionable reliability.
Boldface indicates that data are census results.
* Provisional.
§ Estimates appear not to be in accord with results of latest census.
| Vertical bar indicates marked break in series.
[37] Excludes data for Turks and Caicos Islands.
[38] Estimates are for 5 September.
[39] Includes 8.4 per cent (227 866) adjustment for underenumeration and an estimate of 87 000 for tribal Indian population.
[40] Excluding Indian jungle population, numbering 45 429 at 1950 census and estimated at 150 000 in 1956.
[41] Estimates are for 5 July.
[42] *De jure* population, but excluding Indian jungle population.
[42a] Probably excludes Indian jungle inhabitants, estimated at 350 000 in 1940.
[43] Excluding Indian jungle population, estimated at 100 600 in 1941, numbering 56 705 at 1950 special census of indigenous population and estimated at 31 800 in 1961.
[44] Published by the Pan American Union.
[45] Published by the United Nations Economic Commission for Asia and the Far East.
[46] Beginning 1955, excluding alien armed forces, merchant seamen and foreign diplomatic personnel.
[47] Published by the United Nations Food and Agriculture Organization.
[48] Estimate, based on provisional results of an April 1958 demographic sample survey in 3 460 villages, supplemented by administrative reports.

Italique : Estimations de qualité douteuse.
Caractères gras : Les données proviennent de recensements.
* Données provisoires.
§ Les estimations ne concordent pas avec les résultats du dernier recensement.
| Un filet vertical indique une solution de continuité dans la série.
[37] Non compris les îles Turques et Caïques.
[38] Estimations au 5 septembre.
[39] Après un ajustement destiné à compenser un sous-dénombrement de 8,4 pour 100 (227 866) et compte tenu de l'estimation établie pour les Indiens vivant en tribus (87 000).
[40] Non compris les Indiens de la jungle; 45 429 en 1950 (recensement) et 150 000 en 1956 (estimation).
[41] Estimations au 5 juillet.
[42] Population de droit, mais non compris les Indiens de la jungle.
[42a] Non compris probablement les Indiens de la jungle au nombre de 350 000 en 1940 (estimation).
[43] Non compris les Indiens de la jungle, au nombre de 100 600 en 1941 (estimation) et de 56 705 lors du recensement spécial de la population indigène effectué en 1950 et au nombre de 31 800 en 1961 (estimation).
[44] Chiffres publiés par l'Union panaméricaine.
[45] Chiffres publiés par la Commission économique des Nations Unies pour l'Asie et l'Extrême-Orient.
[46] A partir de 1955, non compris les militaires et le personnel diplomatique étrangers et les marins de commerce.
[47] Chiffres publiés par l'Organisation des Nations Unies pour l'alimentation et l'agriculture.
[48] Estimation établie d'après les résultats provisoires d'une enquête démographique par sondage effectuée en avril 1958 dans 3 460 villages et complétée au moyen de rapports administratifs.

4. Estimations de la population au milieu de l'année (suite)

[49] Estimate, based on results of an April 1959 demographic sample survey in 345 villages and supplementary administrative reports.

[50] Excluding non-resident military and shipping personnel, together numbering 36 606 at 1946 census.

[51] Data for 1949-1956 obtained from *Report on Fulfilment of the National Economic Plan of the People's Republic of China in 1956*.

[52] For 31 December 1957. Estimate revised downward by 10 million to take account of population of Taiwan, erroneously included in previously published figure. Source: *Ten Great Years (Statistics of the Economic and Cultural Achievements of the People's Republic of China)*, published by the State Statistical Bureau, Peking, 1960.

[53] Semi-official estimates range from 670-680 million.

[54] Excluding armed forces and, beginning 1946, foreigners.

[55] Excluding persons in military and special internment camps, numbering 12 422 at 1946 census.

[56] Excluding transients afloat and enemy prisoners of war, numbering 822 and 1 394, respectively, at 1947 census; prior to 1947, also excluding non-locally domiciled service personnel and their families, numbering 12 519 at 1947 census.

[57] Excluding armed forces but including refugees and immigrants, together estimated at 600 000 in 1941. For 1961, including armed forces.

[49] Estimation établie d'après les résultats d'une enquête démographique par sondage effectuée en avril 1959 dans 345 villages et complétée au moyen de rapports administratifs.

[50] Non compris les militaires et agents des compagnies maritimes non résidents, au nombre de 36 606 lors du recensement de 1946.

[51] Source : 1949-1956, *Rapport sur l'exécution du plan économique national de la République populaire de Chine en 1956*.

[52] Au 31 décembre 1957. Estimation diminuée de 10 millions d'unités pour tenir compte de la population de Taïwan, qui était comprise par erreur dans le chiffre publié antérieurement. Source : *Les dix grandes années (Statistiques des réalisations économiques et culturelles de la République populaire de Chine)*, publication du Bureau de statistique d'Etat, Pékin, 1960.

[53] Les estimations semi-officielles varient entre 670 et 680 millions.

[54] Non compris les militaires ni, à partir de 1946, les étrangers.

[55] Non compris les personnes se trouvant dans des camps militaires et des camps d'internement spéciaux (12 422 au recensement de 1946).

[56] Non compris les personnes de passage à bord des navires et les prisonniers de guerre ennemis, soit respectivement 822 et 1 394 personnes lors du recensement de 1947. Pour les années antérieures à 1947, non compris également les fonctionnaires civils domiciliés en dehors du territoire et les membres de leur famille les accompagnant, au nombre de 12 519 lors du recensement de 1947.

[57] Non compris les militaires, mais y compris les réfugiés et les immigrants estimés ensemble à 600 000 en 1941. 1961 : y compris les militaires.

§ Estimates appear not to be in accord with results of latest census.
| Vertical bar indicates marked break in series.

[22] De jure population.

[26] Between 21 February 1958 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only; the former Syrian Region, which seceded on that date, appears as "Syria" under Asia. Data are for the former Egyptian Region.

[45] Published by the United Nations Economic Commission for Asia and the Far East.

[47] Published by the United Nations Food and Agriculture Organization.

[58] Including data for Sikkim (population enumerated at 121 520 in 1941, 137 725 in 1951 and 161 080 in 1961) and also for Kashmir-Jammu, the final status of which has not yet been determined (population enumerated at 3 583 585 in 1961), but prior to 1951, excluding data for Mahé, Karikal, Pondichéry, Yanaon and Chandernagore (together population enumerated at 323 295 in 1941), which were transferred to India by France on 1 November 1954 (for the first four) and 2 May 1950 (for Chandernagore). Beginning 1951, excluding data for North East Frontier Agency (population estimated at 450 000 in 1961) and Nagaland (population estimated at 369 000 in 1961).

[59] Includes population of Netherlands New Guinea.

[59a] For 1959, excludes armed forces and police, and their dependants living in camps.

[60] Prior to 1950, excluding nomad population, numbering approximately 240 000 in 1956. Prior to 1949, estimates are for 20 March.

[61] Includes nationals abroad.

[62] See Palestine below.

[63] Prior to 1952, excluding Tokara Archipelago, acquired from the Ryukyu Islands on 5 December 1951 (population 2 658 in 1955) and prior to 1954, the Amami Islands, acquired from the Ryukyu Islands on 25 December 1953 (population 205 363 in 1955). For 1941-1944, present-in-area population, excluding armed forces stationed outside country, estimated at 1 200 000 in 1940. Beginning 1945, excluding diplomatic personnel outside country and allied military and civilian personnel and their dependants stationed in the area. Prior to 1945 and for 1946, estimates are for 1 October; for 1945, estimate is for 1 November.

Italique : Estimations de qualité douteuse.
Caractères gras : Les données proviennent de recensements.
* Données provisoires.
§ Les estimations ne concordent pas avec les résultats du dernier recensement.
| Un filet vertical indique une solution de continuité dans la série.

[22] Population de droit.

[26] 21 février 1958–29 septembre 1961 : Région égyptienne et Région syrienne. A partir du 29 septembre 1961, ancienne Région égyptienne seulement, l'ancienne Région syrienne ayant fait sécession à cette date, les données pertinentes figurent en regard de la rubrique "Syrie", sous la rubrique générale "Asie". Les données se rapportent à l'ancienne Région égyptienne.

[45] Chiffres publiés par la Commission économique des Nations Unies pour l'Asie et l'Extrême-Orient.

[47] Chiffres publiés par l'Organisation des Nations Unies pour l'alimentation et l'agriculture.

[58] Y compris le Sikkim (121 520 habitants dénombrés en 1941, 137 725 en 1951 et 161 080 en 1961) et le Cachemire-Jammu (3 583 585 habitants dénombrés en 1961), dont le statut définitif n'a pas encore été déterminé, mais non compris, pour les années antérieures à 1951, Mahé, Karikal, Pondichéry, Yanaon et Chandernagor (323 295 habitants dénombrés au total en 1941), cédés à l'Inde par la France le 1er novembre 1954 (pour les quatre premiers comptoirs) et le 2 mai 1950 (pour Chandernagor). A partir de 1951, non compris l'Agence des frontières du nord-est (population estimée à 450 000 habitants en 1961) et le Nagaland (population estimée à 369 000 habitants en 1961).

[59] Y compris la population de la Nouvelle-Guinée néerlandaise.

[59a] 1959 : non compris les militaires, les forces de police et les membres de leur famille vivant dans les camps.

[60] Pour les années antérieures à 1950, non compris les nomades, au nombre de 240 000 environ en 1956. Pour les années antérieures à 1949, estimations au 20 mars.

[61] Y compris les nationaux à l'étranger.

[62] Voir plus bas, Palestine.

[63] Pour les années antérieures à 1952, non compris l'archipel des Tokara, détaché des îles Ryû-kyû et rattaché au Japon le 5 décembre 1951 (2 658 habitants en 1955), et, pour les années antérieures à 1954, les îles Amami, détachées des Ryû-kyû et rattachées au Japon le 25 décembre 1953 (205 363 habitants en 1955). 1941-1944 : population présente, non compris les militaires hors du pays, soit 1 200 000 en 1940 (estimation). A partir de 1945, non compris les membres du corps diplomatique hors du pays, les militaires et agents civils alliés sur le territoire et les membres de leur famille les accompagnant. Pour les années antérieures à 1945 et pour 1946, estimations au 1er octobre; 1945 : estimation au 1er novembre.

4. Estimations de la population au milieu de l'année (suite)

[Voir note au début du tableau.]

[64] Including registered Palestinian refugees, numbering at mid-year 1950-1961, 506 200, 465 741, 469 576, 475 620, 486 631, 499 606, 512 706, 517 388, 539 519, 595 725, 613 743 and 630 725, respectively. Estimates exclude foreigners and also military personnel and their dependants living on military installations.

[65] Estimates are for resident Korean nationals only, based on residents' register.

[66] Excluding alien armed forces, civilian aliens employed by armed forces and foreign diplomatic personnel and their dependants. Prior to 1950, data relate to population in area south of the 38th parallel.

[67] For 1 September.

[68] Data are for Lebanese nationals only, i.e., excluding registered Palestinian refugees, numbering at mid-year 1950-1960, 127 600, 106 896, 104 901, 102 095, 101 636, 103 600, 102 625, 102 586, 102 291, 131 732 and 136 561, respectively.

[69] Shown formerly as Mongolian People's Republic.

[70] For 28 May.

[71] Excluding Labuan, acquired from Straits Settlements in 1946 (population 7 507 at 1 April 1931 census).

[72] Excluding Kashmir-Jammu, the final status of which has not yet been determined, Junagadh, Manavadar, Gilgit and Baltistan. Prior to 1951, also excluding the port and peninsula of Gwadar, acquired from Muscat and Oman on 8 September 1958.

[73] Territory formerly under British mandate. Population excludes military personnel, numbering 5 134 and 2 507 at 1922 and 1931 censuses, respectively.

[74] For 1950-1954 and 1958-1959, data are for registered Palestinian refugees only. Corresponding estimates for 1955-1957 and 1960 are 214 601, 216 971, 221 058 and 256 000, respectively.

[75] For 1941-1943, including, and for 1944, excluding Japanese military personnel. Beginning 1945, excluding Allied military and civilian personnel and their dependants stationed in the area.

[76] For October.

[64] Y compris les réfugiés de Palestine immatriculés dont le nombre (au milieu de chaque année pour la période 1950-1960) s'établit comme suit : 506 200, 465 741, 469 576, 475 620, 486 631, 499 606, 512 706, 517 388, 539 519, 595 725, 613 743 et 630 725 respectivement. Les estimations ne comprennent ni les étrangers ni les militaires et les membres de leur famille vivant dans des locaux militaires.

[65] Nationaux coréens résidents seulement. D'après le registre des résidents.

[66] Non compris les militaires étrangers, les agents civils étrangers travaillant pour les forces armées, les membres du corps diplomatique et les membres de leur famille les accompagnant. Pour les années antérieures à 1950, les données se rapportent à la population du territoire situé au sud du 38ème parallèle.

[67] Au 1er septembre.

[68] Nationaux libanais seulement, c'est-à-dire non compris les réfugiés de Palestine immatriculés dont le nombre (au milieu de chaque année pour la période 1950-1960) s'établit comme suit : 127 600, 106 896, 104 901, 102 095, 101 636, 103 600, 102 625, 102 586, 102 291, 131 732 et 136 561 respectivement.

[69] Antérieurement désignée sous le nom de République populaire mongole.

[70] Au 28 mai.

[71] Non compris l'île de Labouan, détachée des Etablissements des Détroits en 1946 (7 507 habitants au recensement du 1er avril 1931).

[72] Non compris le Junagadh, le Manavadar, le Gilgit et le Baltistan, ni le Cachemire-Jammu, dont le statut définitif n'a pas encore été déterminé. Pour les années antérieures à 1951, non compris également le port et la péninsule de Gwadar, cédés par Mascate et Oman, le 8 septembre 1958.

[73] Territoire auparavant sous mandat britannique. Non compris les militaires au nombre de 5 134 et 2 507 aux recensements de 1922 et 1931 respectivement.

[74] 1950-1954 et 1958-1959 : les données se rapportent uniquement aux réfugiés de Palestine immatriculés. Voici les estimations pour les années 1955-1957 et 1960 : 214 601, 216 971, 221 058 et 256 000 respectivement.

[75] Y compris pour 1941-1943, mais non compris pour 1944, les militaires japonais. A partir de 1945, non compris les militaires et agents civils alliés en poste sur le territoire, ni les membres de leur famille les accompagnant.

[76] En octobre.

4. Estimates of midyear population (continued)

Italics indicate estimates of questionable reliability.
Boldface indicates that data are census results.
* Provisional.
§ Estimates appear not to be in accord with results of latest census.
| Vertical bar indicates marked break in series.
[22] *De jure* population.
[45] Published by the United Nations Economic Commission for Asia and the Far East.
[77] Excluding transients afloat and non-locally domiciled military and civilian services personnel and their dependants, numbering 3 466 and 27 299, respectively at 1957 census. Also excluding Japanese surrendered personnel, numbering 7 517 at 1947 census.
[78] Excluding Palestinian refugees numbering, at 31 December 1950-1959, 86 841, 91 365, 95 574, 98 474, 101 944, 105 515, 109 388, 113 204, 117 437 and 121 859, respectively. Prior to 1952, also excluding nomad population estimated at 179 722 at end of 1956.
[79] Estimates are for 20 October.
[80] Includes displaced persons. Estimate for 1946 is for 21 July; that for 1947, for 22 June.
[81] For 10 October.
[82] Excludes population of 41 communes not under Belgian administration, numbering 88 090 in 1939.
[83] Excluding armed forces.
[84] Excludes data for dependencies of Guernsey.
[85] Prior to 1945, excluding population of one village of former Subcarpathian Russia, but including 12 villages of Eastern Slovakia ceded to USSR in 1945; prior to 1948, excluding Bratislava Bridgehead, acquired from Hungary in 1947 (population 3 379 in 1941).

Italique : Estimations de qualité douteuse.
Caractères gras : Les données proviennent de recensements.
* Données provisoires.
§ Les estimations ne concordent pas avec les résultats du dernier recensement.
| Un filet vertical indique une solution de continuité dans la série.
[22] Population de droit.
[45] Chiffres publiés par la Commission économique des Nations Unies pour l'Asie et l'Extrême-Orient.
[77] Non compris les personnes de passage à bord de navires, ni les militaires et les fonctionnaires civils domiciliés en dehors du territoire et les membres de leur famille les accompagnant, soit respectivement 3 466 et 27 299 personnes lors du recensement de 1957. Non compris également le personnel japonais capturé (7 517 personnes au recensement de 1947).
[78] Non compris les réfugiés de Palestine dont le nombre au 31 décembre de chaque année de la période 1950-1957, s'établit comme suit : 86 841, 91 365, 95 574, 98 474, 101 944, 105 515, 109 388, 113 204, 117 437 et 121 859 respectivement. Pour les années antérieures à 1952, non compris la population nomade estimée à 179 722 personnes à la fin de 1956.
[79] Estimations au 20 octobre.
[80] Y compris les personnes déplacées. 1946 : estimation au 21 juillet; 1947 : au 22 juin.
[81] Au 10 octobre.
[82] Non compris 41 communes ne relevant pas de l'administration belge (88 090 habitants en 1939).
[83] Non compris les militaires.
[84] Non compris les dépendances de Guernesey.
[85] Pour les années antérieures à 1946, non compris un village de l'ancienne Russie subcarpatique, mais y compris 12 villages de la partie orientale de la Slovaquie cédée à l'URSS en 1945; pour les années antérieures à 1948, non compris la tête de pont de Bratislava cédée par la Hongrie en 1947 (3 379 habitants en 1941).

4. Estimations de la population au milieu de l'année (suite)

[Voir note au début du tableau.]

[86] Excluding Faeroe Islands and Greenland, shown separately.

[87] Prior to 1950, data are for Finnish nationals in Finland only; beginning 1950, population present in area, but beginning 1951, including Finnish nationals temporarily outside country.

[88] Excluding alien armed forces, members of foreign diplomatic service in country, French diplomatic service outside country, and prisoners of war (estimated at 663 000 in 1946 and 486 000 in 1947); for 1941-1945, excluding all armed forces outside country but beginning 1946 only members of career military service except those on duty in Germany or Austria. Including merchant seamen at sea, and beginning 1946, military conscripts wherever stationed and all personnel on duty in Germany and Austria and their dependants, together estimated at 312 000 in 1946 and 186 500 (excluding estimate for merchant seamen, who were included in 1954 enumeration) in 1954. Also including civilian residents temporarily outside country.

[89] Data are for territory of 1937 (i.e., including Berlin).

[90] Excluding East Berlin, shown separately below.

[91] Excludes persons in International Refugee Organization camps, prisoners of war and civilians in internment camps.

[92] Excluding armed forces and displaced persons.

[93] Including armed forces stationed outside country but excluding alien armed forces stationed in the area.

[94] Prior to 1951, including armed forces and civilians stationed outside country.

[86] Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.

[87] Pour les années antérieures à 1950, nationaux finlandais se trouvant en Finlande seulement; à partir de 1950, population présente, mais, à partir de 1951, y compris les Finlandais temporairement hors du pays.

[88] Non compris les militaires et le personnel diplomatique étrangers dans le pays, ni le personnel diplomatique français hors du pays, ni les prisonniers de guerre (au nombre de 663 000 en 1946 et de 486 000 en 1947 selon les estimations); 1941-1945 : non compris l'ensemble des militaires hors du pays, mais, à partir de 1946, non compris seulement les militaires de carrière, à l'exception de ceux des troupes d'occupation en Allemagne et en Autriche. Y compris les équipages de la marine marchande en mer et, à partir de 1946, les militaires de contingent où qu'ils se trouvent ainsi que tous les civils et militaires en occupation en Allemagne et en Autriche avec les membres de leur famille les accompagnant, soit au total 312 000 personnes en 1946 et 186 500 en 1954 (déduction faite, dans ce dernier cas, de l'effectif estimé des équipages de la marine marchande compris dans la population dénombrée en 1954). Y compris également les civils résidant temporairement hors du pays.

[89] Territoire de 1937 (c'est-à-dire y compris Berlin).

[90] Non compris Berlin-Est, qui fait l'objet d'une rubrique distincte.

[91] Non compris les personnes dans les camps de l'Organisation internationale pour les réfugiés, les prisonniers de guerre et les civils dans des camps d'internement.

[92] Non compris les militaires et personnes déplacées.

[93] Y compris les militaires en garnison hors du pays, mais non compris les militaires étrangers en garnison sur le territoire.

[94] Pour les années antérieures à 1951, y compris les militaires et civils en poste hors du territoire.

Italics indicate estimates of questionable reliability.
Boldface indicates that data are census results.
* Provisional.
§ Estimates appear not to be in accord with results of latest census.
| Vertical bar indicates marked break in series.
[16] For 31 March.
[22] *De jure* population.
[95] Excluding non-Maltese armed forces stationed in the area and beginning 1957, including civilian nationals temporarily outside country.
[96] Excluding civilian aliens within country and beginning 1960, including civilian nationals temporarily outside country.
[97] Excludes population of Northern Transylvania, temporarily ceded to Hungary.
[98] For 30 April.
[99] Excluding Channel Islands and Isle of Man, shown separately.
[100] Excluding enemy prisoners of war. Including armed forces outside country and merchant seamen at sea but excluding Commonwealth and alien armed forces stationed in the area.

Italique : Estimations de qualité douteuse.
Caractères gras : Les données proviennent de recensements.
* Données provisoires.
§ Les estimations ne concordent pas avec les résultats du dernier recensement.
| Un filet vertical indique une solution de continuité dans la série.
[16] Au 31 mars.
[22] Population de droit.
[95] Non compris les militaires non maltais en garnison sur le territoire, mais, à partir de 1957, y compris les civils nationaux temporairement hors du pays.
[96] Non compris les civils étrangers dans le pays mais, à partir de 1960, y compris les civils nationaux temporairement hors du pays.
[97] Non compris la population de la Transylvanie septentrionale, temporairement cédée à la Hongrie.
[98] Au 30 avril.
[99] Non compris les îles Anglo-Normandes et l'île de Man qui font l'objet de rubriques distinctes.
[100] Pour les années antérieures à 1961, non compris les prisonniers de guerre ennemis. Y compris les militaires nationaux hors du pays et les équipages de la marine marchande en mer, mais non compris les militaires du Commonwealth et les militaires étrangers en garnison sur le territoire.

[101] Note suppressed.
[102] Excluding full-blooded aborigines, estimated at 46 638 in June 1947 and at 39 319 in June 1954. For 1941-1946, including armed forces stationed outside country, but excluding alien armed forces in the area.
[103] Prior to 1959, excluding transients afloat and service personnel in service establishments.
[104] Prior to 1959, estimates are for 31 March.
[105] Including data for the condominium of Canton and Enderbury.
[106] Excludes United States military personnel, their dependants and contract employees.
[107] For 26 August.
[108] Excluding enemy prisoners of war, armed forces stationed outside country and alien armed forces within country.
[109] For Tongan population only.
[110] Prior to 1946, estimates are for 31 March.
[111] For 1 April.
[112] For 1 January.

[101] Note supprimée.
[102] Non compris les aborigènes purs, au nombre de 46 638 en juin 1947 et 39 919 en juin 1954 (estimation). 1941-1946 : y compris les militaires hors du pays, mais non compris les militaires étrangers en garnison sur le territoire.
[103] Pour les années antérieures à 1959, non compris les personnes de passage à bord de navires, ni les militaires dans des établissements officiels.
[104] Pour les années antérieures à 1959, estimations au 31 mars.
[105] Y compris le condominium des îles Canton et Enderbury.
[106] Non compris les militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels américains.
[107] Au 26 août.
[108] Non compris les prisonniers de guerre ennemis, les militaires nationaux hors du pays et les militaires étrangers dans le pays.
[109] Tongans seulement.
[110] Pour les années antérieures à 1946, estimations au 31 mars.
[111] Au 1er avril.
[112] Au 1er janvier.

5. Population by age and sex : latest available year, 1957-1961

[(C) after date indicates data are results of a census of population; all other data are inter-censal or post-censal estimates. Figures shown in italics are estimates of questionable reliability. For method of evaluation and limitations of data, see Technical Notes, page 25.]

[13] Data are estimated, based on provisional results of 1960/61 demographic sample survey.
[14] For under 6 years.
[15] For 6-13 years.
[16] For 14-19 years.
[17] Prior to 31 May 1961, known as Union of South Africa.
[18] Data not revised to accord with 1960 census results and latter not available by age.

[13] Estimations établies d'après les résultats provisoires de l'enquête démographique par sondage de 1960/61.
[14] Moins de 6 ans.
[15] 6-13 ans.
[16] 14-19 ans.
[17] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.
[18] Données non alignées sur les résultats du recensement de 1960, dont le classement selon l'âge n'est pas connu.

Italics indicate estimates of questionable reliability.
(C) after date indicates data are results of a census of population.
[12] Reported as "adults".
[13] Data are estimated, based on provisional results of 1960/61 demographic sample survey.
[14] For under 6 years.
[19] Differs slightly from corresponding estimate shown elsewhere because it is a mean of end-year estimates rather than an estimate as of 1 July.

Italique : estimations de qualité douteuse.
(C) après la date signifie qu'il s'agit de résultats d'un recensement de population.
[12] Classées dans la catégorie "adultes".
[13] Estimations établies d'après les résultats provisoires de l'enquête démographique par sondage de 1960/61.
[14] Moins de 6 ans.
[19] Ces chiffres s'écartent légèrement de l'estimation correspondante donnée ailleurs car il s'agit d'une moyenne des estimations de fin d'année et non d'une estimation au 1er juillet.

[20] Because of rounding, totals are not in all cases the sum of the parts.
[21] For under 16 years.
[22] For 16 years and over.
[23] Excluding armed forces.
[24] For 6-14 years.
[25] Reported as "old people" *(vieillards)*.
[26] Excluding persons in transit.
[27] For 20-45 years.
[28] For 46 years and over.
[29] *De jure* population.

[20] Les chiffres ayant été arrondis, les totaux ne coïncident pas toujours avec la somme des données partielles.
[21] Moins de 16 ans.
[22] 16 ans et plus.
[23] Non compris les militaires.
[24] 6-14 ans.
[25] Classées dans la catégorie "vieillards".
[26] Non compris les personnes de passage.
[27] 20-45 ans.
[28] 46 et plus.
[29] Population de droit.

Italics indicate estimates of questionable reliability.
(C) after date indicates data are results of a census of population.
* Provisional.
[10] Data exclude migratory balance, not available by age and sex.
[19] Differs slightly from corresponding estimate shown elsewhere because it is a mean of end-year estimates rather than an estimate as of 1 July.

Italique : estimations de qualité douteuse.
(C) après la date signifie qu'il s'agit de résultats d'un recensement de population.
* Données provisoires.
[10] Non compris la migration nette pour laquelle on ne possède pas de données selon l'âge et le sexe.
[19] Ces chiffres s'écartent légèrement de l'estimation correspondante donnée ailleurs car il s'agit d'une moyenne des estimations de fin d'année et non d'une estimation au 1er juillet.

Population selon l'âge et le sexe (suite)

[r note au début du tableau.]

[29] De *jure* population.
[30] De *jure* population, but including armed forces stationed in the area.
[31] Differs slightly from corresponding figure shown in Tables 1 and 4 because sum of estimated distribution by age and sex was not adjusted to conform to independent estimate of total population.
[32] Data are for Aruba and Curaçao only.
[33] Excluding data for Canal Zone, shown separately above. Also excluding Indian jungle population, numbering *60 540.

[29] Population de droit.
[30] Population de droit, mais y compris les militaires en garnison sur le territoire.
[31] Ce chiffre s'écarte légèrement de l'estimation correspondante donnée aux tableaux 1 et 4 car la somme des estimations selon l'âge et le sexe ne tient pas compte de l'estimation établie séparément pour la population totale.
[32] Aruba et Curaçao seulement.
[33] Non compris la Zone du Canal qui fait l'objet d'une rubrique distincte. Non compris également les Indiens de la jungle, au nombre de *60 540.

[10] *De jure* population, but including armed forces stationed in the area.
[14] Excluding armed forces overseas, estimated at 609 720, and their dependants living abroad, crews of American vessels at sea or in foreign ports, and American citizens living in foreign countries.
[15] For under 2 years.
[36] For 2-14 years.

[30] Population de droit, mais y compris les militaires en garnison sur le territoire.
[34] Non compris les militaires à l'étranger, au nombre de 609 720 (estimation) ni les membres de leur famille à l'étranger, ni les équipages des navires des Etats-Unis en mer ou dans des ports étrangers, ni les citoyens américains à l'étranger.
[35] Moins de 2 ans.
[36] 2-14 ans.

Italics indicate estimates of questionable reliability.
(C) after date indicates data are results of a census of population.
* Provisional.
[19] Differs slightly from corresponding estimate shown elsewhere because it is a mean of end-year estimates rather than an estimate as of 1 July.
[23] Excluding armed forces.
[37] Excluding Amerindian population, estimated at 21 156 in 1958.
[38] Excluding adjustment for underenumeration.
[39] Excluding persons of unknown age and sex, numbering 99 912 for both sexes, and also an adjustment for underenumeration.
[40] Sum of frequencies shown for male and female is 94 942. Reason for discrepancy not ascertained.

Italique : estimations de qualité douteuse.
(C) après la date signifie qu'il s'agit de résultats d'un recensement de population.
* Données provisoires.
[19] Ces chiffres s'écartent légèrement de l'estimation correspondante donnée ailleurs, car il s'agit d'une moyenne des estimations de fin d'année et non d'une estimation au 1er juillet.
[23] Non compris les militaires.
[37] Non compris les Amérindiens, au nombre de 21 156 en 1958 (estimation).
[38] Non compris un ajustement pour sous-dénombrement.
[39] Non compris les personnes d'âge et sexe inconnus (99 912 pour les deux sexes) ainsi qu'un ajustement pour sous-dénombrement.
[40] La somme des données pour le sexe masculin et le sexe féminin est de 94 942. On ne sait pas comment s'explique cette divergence.

[41] Sum of frequencies shown for male and female is 4 323. Reason for discrepancy is apparently incorrect frequencies for male and female.
[42] Excluding alien armed forces, merchant seamen and foreign diplomatic personnel, but including civilian aliens.
[43] For 60-75 years.
[44] For 76 years and over.
[45] Excluding Allied military and civilian personnel and their dependants stationed in the area.
[46] Data are estimates, based on results of a demographic sample survey in 345 villages and supplementary administrative reports.
[47] Excluding armed forces and foreigners.
[48] Excluding transients afloat.

[41] La somme des données pour le sexe masculin et le sexe féminin est de 4 323. Cette divergence s'explique par l'inexactitude apparente des données concernant le sexe masculin et le sexe féminin.
[42] Non compris les membres de forces armées, de la marine marchande et du corps diplomatique de pays étrangers, mais y compris les civils étrangers.
[43] 60-75 ans.
[44] 76 ans et plus.
[45] Non compris les militaires et les civils alliés en poste sur le territoire, ainsi que les membres de leur famille les accompagnant.
[46] Estimations établies d'après les résultats de l'enquête démographique par sondage effectuée dans 345 villages et complétée au moyen de rapports administratifs.
[47] Non compris les militaires et les étrangers.
[48] Non compris les personnes de passage à bord de navires.

Italics indicate estimates of questionable reliability.
(C) after date indicates data are results of a census of population.
* Provisional.
[18] Data not revised to accord with 1960 census results and latter not available by age.
[19] Differs slightly from corresponding estimate shown elsewhere because it is a mean of end-year estimates rather than an estimate as of 1 July.
[45] Excluding Allied military and civilian personnel and their dependants stationed in the area.
[49] Frequencies by age are estimated, based on stratified random sample pilot census.

Italique : estimations de qualité douteuse.
(C) après la date signifie qu'il s'agit de résultats d'un recensement de population.
* Données provisoires.
[18] Données non alignées sur les résultats du recensement de 1960, dont le classement selon l'âge n'est pas connu.
[19] Ces chiffres s'écartent légèrement de l'estimation correspondante donnée ailleurs, car il s'agit d'une moyenne des estimations de fin d'année et non d'une estimation au 1er juillet.
[45] Non compris les militaires et les civils alliés en poste sur le territoire, ainsi que les membres de leur famille les accompagnant.
[49] Les données concernant l'âge résultent d'estimations établies à partir des résultats d'un recensement pilote par sondage au hasard portant sur un échantillon stratifié.

5. Population selon l'âge et le sexe (suite)

[Voir note au début du tableau.]

[50] Excluding diplomatic personnel outside country and Allied military and civilian personnel and their dependants stationed in the area. Data based on 1 per cent sample of census returns.

[51] Excluding armed forces, prisoners, ships' crews and foreigners.

[52] Excluding Bedouin population, numbering 15 679 for both sexes (male, 10 267; female, 5 412).

[53] Excluding transients afloat and non-locally domiciled military and civilian services personnel and their dependants, numbering 3 466 and 27 299, respectively.

[50] Non compris les membres du corps diplomatique hors du pays ni les militaires et les civils alliés en poste sur le territoire ainsi que les membres de leur famille les accompagnant. Données calculées à partir d'un chiffre établi sur la base d'un échantillon de 1 pour 100 des bulletins de recensement.

[51] Non compris les militaires, les prisonniers, les équipages de navires et les étrangers.

[52] Non compris les Bédouins au nombre de 15 679 pour les deux sexes (dont 10 267 pour le sexe masculin et 5 412 pour le sexe féminin).

[53] Non compris les personnes de passage à bord de navires ni les militaires et fonctionnaires civils domiciliés en dehors du territoire, ainsi que les membres de leur famille les accompagnant, soit 3 466 et 27 299 personnes, respectivement.

Italics indicate estimates of questionable reliability.
* Provisional.
[18] Data not revised to accord with 1960 census results and latter not available by age.
[19] Differs slightly from corresponding estimate shown elsewhere because it is a mean of end-year estimates rather than an estimate as of 1 July.
[20] Because of rounding, totals are not in all cases the sum of the parts.
[29] *De jure* population.

Italique : estimations de qualité douteuse.
* Données provisoires.
[18] Données non alignées sur les résultats du recensement de 1960, dont le classement selon l'âge n'est pas connu.
[19] Ces chiffres s'écartent légèrement de l'estimation correspondante donnée ailleurs, car il s'agit d'une moyenne des estimations de fin d'année et non d'une estimation au 1er juillet.
[20] Les chiffres ayant été arrondis, les totaux ne coïncident pas toujours avec la somme des données partielles.
[29] Population de droit.

5. Population selon l'âge et le sexe (suite)

[Voir note au début du tableau.]

[54] Excluding Faeroe Islands and Greenland.
[55] Including Finnish nationals temporarily outside country.
[56] Including an allowance for residents temporarily outside country (comprised principally of young men serving military duty) who in 1954 were estimated at 187 000.
[57] For 1-5 years.
[58] For 6-9 years.
[59] For 15-20 years.
[60] For 21-24 years.

[54] Non compris les îles Féroé et le Groenland.
[55] Y compris les Finlandais temporairement hors du pays.
[56] Y compris un ajustement concernant les résidents temporairement hors du pays (principalement les militaires du contingent) qui en 1954 étaient au nombre de 187 000 (estimation).
[57] 1-5 ans.
[58] 6-9 ans.
[59] 15-20 ans.
[60] 21-24 ans.

[60] For 21-24 years.
[61] Differs slightly from corresponding estimate shown elsewhere because it is a mean of monthly estimates rather than an estimate as of 1 July.
[62] Age classification based on difference between year of birth and year of estimate.
[63] Including armed forces stationed outside country, but excluding alien armed forces stationed in the area.
[64] Data based on 1 per cent representative sample of census returns.
[65] Data refer to mean of 1 December 1959 and 31 December 1960 estimates.

[60] 21-24 ans.
[61] Ce chiffre s'écarte légèrement de l'estimation correspondante donnée ailleurs car il s'agit d'une moyenne d'estimations mensuelles et non d'une estimation au 1er juillet.
[62] Le classement selon l'âge repose sur la différence entre l'année de la naissance et l'année de l'estimation.
[63] Y compris les militaires hors du territoire mais non compris les militaires étrangers en garnison sur le territoire.
[64] Estimation établie à partir d'un échantillon représentatif de 1 pour cent des bulletins de recensement.
[65] Moyenne des estimations au 1er décembre 1959 et au 31 décembre 1960.

5. Population by age and sex (continued)

Italics indicate estimates of questionable reliability.
(C) after date indicates data are results of a census of population.
* Provisional.
[18] Data not revised to accord with 1960 census results and latter not available by age.
[19] Differs slightly from corresponding estimate shown elsewhere because it is a mean of end-year estimates rather than an estimate as of 1 July.
[21] For under 16 years.
[29] *De jure* population.
[62] Age classification based on difference between year of birth and year of estimate.

Italique : estimations de qualité douteuse.
(C) après la date signifie qu'il s'agit de résultats d'un recensement de population.
* Données provisoires.
[18] Données non alignées sur les résultats du recensement de 1960, dont le classement selon l'âge n'est pas connu.
[19] Ces chiffres s'écartent légèrement de l'estimation correspondante donnée ailleurs, car il s'agit d'une moyenne des estimations de fin d'année et non d'une estimation au 1er juillet.
[21] Moins de 16 ans.
[29] Population de droit.
[62] Le classement selon l'âge repose sur la différence entre l'année de la naissance et l'année de l'estimation.

5. Population selon l'âge et le sexe (suite)

Italics indicate estimates of questionable reliability.
(C) after date indicates data are results of a census of population.
* Provisional.
[20] Because of rounding, totals are not in all cases the sum of the parts.
[29] *De jure* population.
[72] Including armed forces stationed outside country but excluding other Commonwealth and alien armed forces stationed in the area.
[72a] Data based on 5 per cent sample of census returns.

Italique : estimations de qualité douteuse.
(C) après la date signifie qu'il s'agit de résultats d'un recensement de population.
* Données provisoires.
[20] Les chiffres ayant été arrondis, les totaux ne coïncident pas toujours avec la somme des données partielles.
[29] Population de droit.
[72] Y compris les militaires à l'étranger, mais non compris les militaires du Commonwealth et de pays étrangers en garnison sur le territoire.
[72a] Données calculées à partir d'un chiffre établi sur la base d'un échantillon de 5 pour 100 des bulletins de recensement.

[77] Excluding armed forces outside country, numbering 2 162 at 1956 census and 2 559 at 1961 census, and alien armed forces stationed within country.
[78] Excluding United States military personnel, their dependants and contract employees.
[79] For 10-15 years.
[80] For 16-19 years.

[77] Non compris les militaires hors du pays, au nombre de 2 162 au recensement de 1956 et de 2 559 au recensement de 1961, ni les militaires étrangers en garnison sur le territoire.
[78] Non compris les militaires des Etats-Unis et les membres de leur famille les accompagnant, ni les agents contractuels des Etats-Unis.
[79] 10-15 ans.
[80] 16-19 ans.

6. Live births, 1952–1961 and crude live birth rates, 1945–59 and 1952–1961

[Rates are the number of live births per 1 000 population. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 26.]

Italics: Data are unreliable or of unknown completeness.

* Provisional.

† Data tabulated by year of registration rather than occurrence.

[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.

[2] Including the two Departments of the Sahara.

[3] Data exclude live-born infants dying before registration of birth.

[4] Four-year average.

[5] Three-year average.

[6] Rates computed on population excluding personnel in military establishments.

[7] Data are baptisms recorded in church registers.

[8] Estimated rate, based on results of sample surveys. Rate given for 1955-59 is for 1955-60.

[9] European, Indian and Coloured (mixed) population, together comprising about one per cent of the total.

[10] Rate(s) not computed by the Statistical Office of the United Nations.

[11] For European population only.

[12] Excluding Southern Cameroons, which was formerly a part of United Nations Trust Territory of the Cameroons under British Administration and which became part of the Republic of Cameroun on 1 October 1961.

[13] Two-year average.

[14] For indigenous population only.

[15] For 1953.

[16] For 1959.

[17] Estimated rate for Centre Oubangui, based on results of 1959 demographic sample survey of 167 clusters of villages and one urban centre.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.

[2] Y compris les deux départements du Sahara.

[3] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.

[4] Moyenne pour quatre ans.

[5] Moyenne pour trois ans.

[6] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires casernés.

[7] D'après les baptêmes inscrits sur les registres des églises.

[8] Taux estimatifs obtenus à partir des résultats d'enquêtes par sondage. Le taux figurant dans la colonne 1955-59 ne se rapporte qu'à la période 1955-60.

[9] Européens, personnes d'origine indienne et personnes de couleur (métis), représentant ensemble 1 pour 100 environ de la population totale.

[10] Le calcul de ce(s) taux n'a pas été fait au Bureau de statistique des Nations Unies.

[11] Population européenne seulement.

[12] Non compris le Cameroun méridional, qui faisait précédemment partie du Territoire sous tutelle du Cameroun sous administration britannique et qui est devenu partie intégrante de la République du Cameroun le 1er octobre 1961.

[13] Moyenne pour deux ans.

[14] Population indigène seulement.

[15] 1953.

[16] 1959.

[17] Taux estimatif concernant la population du Centre-Oubangui; ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage effectuée en 1959 dans 167 grappes de villages et un centre urbain.

6. Naissances vivantes 1952–1961 et taux bruts de natalité 1945–59 et 1952–1961

Les taux représentent le nombre de naissances vivantes pour 1 000 habitants. Les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et les insuffisances des données, voir Notes Techniques, page 77.]

[18] For 1955.
[19] Estimated rate, based on results of annual demographic sample survey; corresponding recorded rate for 1953 was 30.0.
[20] For 1954.
[21] Based on results of May-September 1961 demographic sample survey.
[22] Data are for a compulsory registration area of 36 towns and townships which comprised about 12 per cent of total population and is not representative of Ghana.
[23] For registration area only; registration in rest of country incomplete.
[24] Estimated rate, based on results of 1955 demographic sample survey of residents, but rate computed on total population including non-residents.
[25] For indigenous population living outside main towns.
[26] For 1956.
[27] Estimated rate for indigenous rural population, based on results of 1957-1958 demographic sample survey of 69 villages.
[27a] Estimated rate, based on results of demographic sample surveys.
[28] Estimated rate, based on incomplete provisional results of June 1960-May 1961 demographic sample survey.
[28a] Estimated rate, basis unknown.
[29] Northern part of former Spanish Protectorate.
[30] Data exclude live-born infants dying within 24 hours of birth.
[31] Civil registration system for Moslem population introduced 1 July 1954.
[32] The former French Protectorate.
[33] Population which has fulfilled certain conditions established by law, i.e., achieved a prescribed degree of material and social development as measured by educational level, language used and mode of living.

[18] 1955.
[19] Taux estimatif obtenu à partir des résultats d'une enquête démographique annuelle par sondage; 1953: le taux correspondant calculé d'après les données de l'enregistrement est de 30,0.
[20] 1954.
[21] Taux obtenu à partir des résultats de l'enquête démographique par sondage de mai-septembre 1961.
[22] Données se rapportant à une zone où l'enregistrement est obligatoire; cette zone se compose de 36 villes et municipalités comptant 12 pour 100 environ de la population totale et n'est pas représentative de l'ensemble du Ghana.
[23] Zone d'enregistrement seulement; enregistrement incomplet dans le reste du pays.
[24] Taux estimatif obtenu à partir des résultats de l'enquête démographique par sondage de 1955 sur les résidents; toutefois, ce taux a pour base la population totale (y compris les non-résidents).
[25] Population indigène vivant hors des villes principales.
[26] 1956.
[27] Taux estimatif concernant la population indigène rurale; ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage effectuée en 1957-1958 dans 69 villages.
[27a] Taux estimatif obtenu à partir des résultats d'enquêtes démographiques par sondage.
[28] Taux estimatif obtenu à partir des résultats provisoires incomplets de l'enquête démographique par sondage de juin 1960-mai 1961.
[28a] Taux estimatif; base inconnue.
[29] Partie nord de l'ancien protectorat espagnol.
[30] Non compris les enfants nés vivants décédés dans les 24 heures qui ont suivi leur naissance.
[31] Un système d'enregistrement des faits d'état civil pour la population musulmane est entré en vigueur le 1er juillet 1954.
[32] Ancien protectorat français.
[33] Population remplissant certaines conditions fixées par la loi, c'est-à-dire ayant atteint un degré de développement matériel et social déterminé du point de vue du niveau d'instruction, de la langue parlée et du mode de vie.

6. Live births and crude birth rates (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[3] Data exclude live-born infants dying before registration of birth.
[4] Four-year average.
[5] Three-year average.
[13] Two-year average.
[14] For indigenous population only.
[18] For 1955.
[20] For 1954.
[25] For indigenous population living outside main towns.
[29] Data exclude infants dying within 24 hours of birth.
[34] For 1957.
[35] Estimated rate for indigenous population; basis unknown.
[36] Registration believed to be complete for civilized population only, which represents a relatively small proportion of the total.
[37] For 1949.
[38] For 1950. Estimated rate, based on results of 1950 demographic sample survey.
[39] For 1948. Estimated rate for village population, based on results of 1948 demographic sample survey.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[3] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[4] Moyenne pour quatre ans.
[5] Moyenne pour trois ans.
[13] Moyenne pour deux ans.
[14] Population indigène seulement.
[18] 1955.
[20] 1954.
[25] Population indigène vivant hors des villes principales.
[29] Non compris les enfants nés vivants décédés dans les 24 heures qui ont suivi leur naissance.
[34] 1957.
[35] Population indigène: taux estimatif; base inconnue.
[36] L'enregistrement ne serait complet que pour la population "civilisée", qui ne représente qu'une fraction relativement faible de la population totale.
[37] 1949.
[38] 1950. Taux estimatif obtenu à partir des résultats de l'enquête démographique par sondage de 1950.
[39] 1948. Taux estimatif concernant la population des villages; ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage de 1948.

6. Naissances vivantes et taux bruts de natalité (suite)

[Voir note au début du tableau.]

[40] Estimated rate for village population, based on results of 1953-1955 demographic sample survey.
[41] Estimated rates, based on results of annual demographic sample survey(s).
[42] Estimated rate for Basse Vallée (population estimated at 250 000), based on results of 1957-1958 demographic sample survey of 77 rural villages and 5 urban centres.
[43] Former British dependency; declared independent 27 April 1961.
[44] For Freetown only.
[45] For Italian population of former Italian Somaliland only.
[46] Prior to 31 May 1961, known as Union of South Africa.
[47] Marked increase observed beginning 1953 due to extension of compulsory civil registration to native (Bantu) population in rural areas on 1 January 1952.
[48] Prior to 1958, includes data for the southern part of former Spanish Protectorate of Morocco transferred to Morocco on 10 April 1958.
[49] Estimate, based on results of 1955-1956 sample census of population.
[50] For 1947. Estimated rate, based on results of 1948 sample census of population.
[51] Estimated rate for Pays Kabré (population estimated at 150 000), based on results of 1957 demographic sample survey of 527 hamlets.
[52] Estimated rate for urban population, based on results of 1958-1960 census.
[53] Marked increase observed in 1955 due to extension of civil registration facilities in 1954.

[40] Taux estimatif concernant la population des villages; ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage de 1953-1955.
[41] Taux estimatifs obtenus à partir des résultats d'une (ou de plusieurs) enquête(s) annuelle(s) démographique(s) par sondage.
[42] Taux estimatif concernant la population de la Basse Vallée (estimée à 250 000 habitants); ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage effectuée en 1957-1958 dans 77 villages ruraux et 5 centres urbains.
[43] Ancienne dépendance britannique; proclamée indépendante le 27 avril 1961.
[44] Freetown seulement.
[45] Population italienne de l'ancienne Somalie italienne seulement.
[46] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.
[47] Les augmentations sensibles observées depuis 1953 s'expliquent par l'extension, le 1er janvier 1952, d'un système d'enregistrement obligatoire pour les indigènes (Bantous) des régions rurales.
[48] Antérieurement à 1958, y compris la partie sud de l'ancien protectorat espagnol du Maroc, cédée au Maroc le 10 avril 1958.
[49] Estimation établie à partir des résultats du recensement par sondage de la population effectué en 1955-1956.
[50] 1947. Taux estimatif obtenu à partir des résultats du recensement par sondage de la population, effectué en 1948.
[51] Taux estimatif concernant la population du pays kabré (estimée à 150 000 habitants); ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage effectuée en 1957 dans 527 hameaux.
[52] Taux estimatif concernant la population urbaine, obtenu à partir des résultats du recensement de 1958-1960.
[53] Les augmentations sensibles observées depuis 1955 s'expliquent par l'extension des services de l'état civil en 1954.

6. Live births and crude birth rates (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.

* Provisional.

† Data tabulated by year of registration rather than occurrence.

[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.

[3] Data exclude live-born infants dying before registration of birth.

[4] Four-year average.

[5] Three-year average.

[14] For indigenous population only.

[20] For 1954.

[29] Data exclude infants dying within 24 hours of birth.

[54] Excluding Algerian refugees temporarily in the country, estimated at about 180 000 in 1959.

[55] Prior to 1957, data stated to be incomplete.

[56] For 1947. Estimated rate, based on results of 1948 sample census of population; average of corresponding recorded rates for 1947 and 1949 is 24.5.

[57] Between 21 February 1958 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only. The former Syrian Region, which seceded on that date, appears as "Syria" under Asia. Data are for the former Egyptian Region.

[58] Birth registration in country as a whole estimated to be about 80 per cent complete in 1956.

[59] For localities having Health Bureaux, which comprised 44.6 per cent of local population in 1958.

[59a] For 1960-61. Estimated rate, based on results of October 1960-April 1961 demographic sample survey of indigenous population of 226 villages and 12 urban centres, covering approximately 185 000 persons.

[60] Estimated rate for Afro-Arab population in Zanzibar, based on results of 1958 population census; corresponding rate for Pemba is 40. Corresponding recorded rate for Zanzibar and Pemba is 17.3.

[61] Excluding tourists and United Kingdom and United States armed forces and their dependants stationed in the area.

[62] Prior to 1956, data tabulated by year of registration rather than occurrence.

[63] Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.

[3] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.

[4] Moyenne pour quatre ans.

[5] Moyenne pour trois ans.

[14] Population indigène seulement.

[20] 1954.

[29] Non compris les enfants nés vivants décédés dans les 24 heures qui ont suivi leur naissance.

[54] Non compris les réfugiés algériens temporairement dans le pays, au nombre de 180 000 en 1959 (estimation).

[55] Antérieurement à 1957, les données sont considérées incomplètes.

[56] 1947. Taux estimatif obtenu à partir des résultats de l'enquête par sondage de 1948 sur la population; la moyenne des taux correspondants calculés pour 1947 et 1949 d'après les données de l'enregistrement est de 24,5.

[57] 21 février 1958-29 septembre 1961: Région égyptienne et Région syrienne. A partir du 29 septembre 1961, ancienne Région égyptienne seulement, l'ancienne Région syrienne ayant fait sécession à cette date, les données pertinentes figurent en regard de la rubrique "Syrie", sous la rubrique générale "Asie". Les données se rapportent à l'ancienne Région égyptienne.

[58] 1956: l'enregistrement saisirait environ 80 pour 100 des naissances.

[59] Données concernant les localités dotées d'un bureau d'hygiène, qui comprenaient 44,6 pour 100 de la population totale en 1958.

[59a] 1960-61. Taux estimatif obtenu à partir des résultats de l'enquête démographique par sondage effectuée en octobre 1960-avril 1961 sur la population indigène répartie dans 226 villages et 12 centres urbains, couvrant approximativement 185 000 personnes.

[60] Taux estimatif concernant la population afro-arabe de Zanzibar; ce taux a été obtenu à partir des résultats du recensement de population de 1958. Pour Pemba le taux correspondant est de 40. Le taux correspondant calculé d'après les données de l'enregistrement pour Zanzibar et Pemba est de 17,3.

[61] Non compris les touristes ni les militaires du Royaume-Uni et des Etats-Unis en garnison sur le territoire, et les membres de leur famille les accompagnant.

[62] Pour les années antérieures à 1956, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[63] Y compris les résidents canadiens se trouvant temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis se trouvant temporairement au Canada.

6. Naissances vivantes et taux bruts de natalité (suite)

[Voir note au début du tableau.]

[64] For 1945, data tabulated by year of registration. Beginning 1946, data are births registered during the period 1946-1960, tabulated by year of occurrence. According to a study of births registered 1946-1953, 81 per cent were registered in year of occurrence, 93.5 per cent within 2 years and 94.7 per cent within 3 years.

[65] Estimated rate, based on demographic analysis of 1943 and 1953 census returns; recorded average rate for 1945-49 is 30.3.

[66] Prior to 1952, data tabulated by year of occurrence.

[67] Prior to 1951, data tabulated by year of registration rather than occurrence.

[68] Inclusion of live-born infants dying before registration of birth (which are registered as "stillbirths" although they are known to have breathed) produces rates for 1951-1957 and 1959 of 39.6, 39.3, 39.4, 39.3, 40.4, 39.7, 37.7 and 37.5, respectively. Inclusion of an additional number of "stillbirths" whose ability to breathe was not reported would increase rates for the same period to 40.6, 39.6, 40.2, 38.4, 41.2, 40.4, 37.9 and 37.8, respectively.

[69] Birth registration estimated to be 85-90 per cent complete in 1956. Rates for 1945-1950 are based on births which have been adjusted for underregistration of 3 per cent for 1945-1949 and 1.5 per cent for 1950.

[70] Inclusion of live-born infants dying before registration of birth (which are registered as "stillbirths" although they are known to have breathed) produces rates for 1951-1959 of 39.1, 38.3, 40.6, 40.3, 39.9, 40.4, 40.9, 39.2 and 38.7, respectively. Inclusion of an additional number of "stillbirths" whose ability to breathe was not reported would increase rates for the same period to 39.9, 38.8, 40.9, 40.7, 40.3, 40.7, 41.5, 39.7 and 39.1, respectively.

[71] Beginning 1950, including residents outside the islands if listed in the population register of Netherlands Antilles. Except for Curaçao since 1957, data exclude live-born infants dying before registration of birth.

[72] Data are for Aruba, Bonaire and Curaçao only.

[73] Excluding data for Canal Zone, shown separately above. Prior to 1952, excluding tribal Indian population, numbering 48 654 in 1950 and *60 540 in 1960. Beginning 1952, including tribal Indian population in Provinces of Bocas del Toro and Darién, where they constitute a relatively high proportion of the population (40.8 and 28.5 per cent, respectively).

[74] Three-year average. Rate for 1950-54, excluding tribal Indian population, is *36.2.

[64] 1945: données exploitées selon l'année de l'enregistrement. A partir de 1946, naissances enregistrées pendant la période 1946-1960, classées selon l'année de l'événement. D'après une étude des naissances enregistrées en 1946-1953, 81 pour 100 le sont dans l'année de l'événement, 93,5 pour 100 dans les 2 ans et 94,7 pour 100 dans les 3 ans.

[65] Taux estimatif obtenu à partir des résultats de l'analyse démographique des recensements de 1943 et 1953; la moyenne des taux calculés d'après les données de l'enregistrement pour 1945-49 s'établit à 30,3.

[66] Pour les années antérieures à 1952, données exploitées selon l'année de l'événement.

[67] Pour les années antérieures à 1951, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[68] Compte tenu des décès d'enfants survenus avant l'enregistrement de leur naissance (ces enfants sont classés parmi les "mort-nés" bien que l'on sache qu'ils ont respiré), les taux pour les années 1951-1957 et 1959 s'établissent comme suit: 39,6; 39,3; 39,4; 39,3; 40,4; 39,7; 37,7 et 37,5, respectivement. Compte tenu du nombre supplémentaire des "mort-nés" dont on ignore s'ils ont pu respirer, les taux correspondants s'établissent comme suit: 40,6; 39,6; 40,2; 38,4; 41,2; 40,4; 37,9; et 37,8, respectivement.

[69] En 1956, l'enregistrement aurait saisi 85 à 90 pour 100 des naissances. Pour 1945-1950 les taux ont été calculés d'après un chiffre de naissances qui a été ajusté comme suit pour compenser les lacunes de l'enregistrement: 1945-1949, 3 pour 100; 1950, 1,5 pour 100.

[70] Compte tenu des décès d'enfants survenus avant l'enregistrement de leur naissance (ces enfants sont classés parmi les "mort-nés" bien que l'on sache qu'ils ont respiré), les taux pour les années 1951-1959 s'établissent comme suit: 39,1; 38,3; 40,6; 40,3; 39,9; 40,4; 40,9; 39,2 et 38,7, respectivement. Compte tenu du nombre supplémentaire des "mort-nés" dont on ignore s'ils ont pu respirer, les taux correspondants s'établissent comme suit: 39,9; 38,8; 40,9; 40,7; 40,3; 40,7; 41,5; 39,7 et 39,1, respectivement.

[71] A partir de 1950, y compris les résidents se trouvant hors du territoire s'ils sont inscrits sur les registres de population des Antilles néerlandaises.

[72] Aruba, Bonaire et Curaçao seulement.

[73] Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte (voir plus haut). Pour les années antérieures à 1952, non compris les Indiens vivant en tribus (au nombre de 48 654 en 1950 et de *60 540 en 1960). A partir de 1952, y compris les Indiens vivant en tribus dans les provinces de Bocas del Toro et de Darién, qui représentent une proportion relativement importante de la population (40,8 et 28,5 pour 100, respectivement).

[74] Moyenne pour trois ans. Le taux pour 1950-54, calculé sur la base d'un chiffre ne comprenant pas les Indiens vivant en tribus, est de *36,2.

6. Live births and crude birth rates (continued)

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[3] Data exclude live-born infants dying before registration of birth.
[4] Four-year average.
[5] Three-year average.
[6] Rates based on population excluding personnel in military establishments.
[13] Two-year average.
[18] For 1955.
[75] For 1959, excludes data for Turks and Caicos Islands.
[76] Prior to 1954, data tabulated by year of registration rather than occurrence.
[77] Prior to 1948, data exclude live-born infants dying within 24 hours of birth.
[78] Estimated average annual rate for 1940-50 for population born in Brazil, based on demographic analysis of 1940 and 1950 census returns.
[79] Data published by the World Health Organization Regional Office for the Americas. For 1950-1952, excluding data for São Paulo; for 1953-1956, data are for 8 state capitals.
[80] Excluding Amerindians, shown separately below.
[81] For 1945-1950, data are estimates based on population enumerated at 1952 census and death statistics for 1945-1952. Beginning 1951, data are births tabulated by year of occurrence, but include an upward adjustment for underregistration of 8.8 per cent for 1951 and 5 per cent for 1952-1957.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données explcitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[3] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[4] Moyenne pour quatre ans.
[5] Moyenne pour trois ans.
[6] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires casernés.
[13] Moyenne pour deux ans.
[18] 1955.
[75] 1959: Non compris les îles Turques et Caïques.
[76] Pour les années antérieures à 1954, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[77] Pour les années antérieures à 1948, non compris les enfants nés vivants décédés dans les 24 heures qui ont suivi leur naissance.
[78] Taux annuel moyen estimatif pour 1940-50 concernant la population née au Brésil; ce taux a été obtenu à partir des résultats d'une analyse démographique des recensements de 1940 et de 1950.
[79] Chiffres publiés par l'Organisation mondiale de la santé (Bureau régional des Amériques). 1950-1952: non compris São Paulo; 1953-1956: 8 capitales d'État seulement.
[80] Non compris les Amérindiens, qui font l'objet d'une rubrique distincte (voir plus bas).
[81] 1945-1950: estimations établies d'après la population dénombrée au recensement de 1952 et les statistiques de la mortalité de 1945-1952. A partir de 1951, les données représentent les naissances classées selon la date de l'événement, compte tenu d'un ajustement pour sous-enregistrement de 8,8 pour 100 pour 1951 et 5 pour 100 pour 1952-1957.

6. Naissances vivantes et taux bruts de natalité (suite)

[Voir note au début du tableau.]

[82] Data are baptisms recorded in Roman Catholic church registers.
[83] Excluding Indian jungle population. Prior to 1955, data exclude births in Galápagos Islands and, prior to 1954, also those in Provinces of Napo Pastaza, Morona Santiago and Zamora Chinchipe, but rates computed on total population.
[84] Registration estimated to be about 70 per cent complete in 1956. Prior to 1954, data are tabulated by year of registration rather than occurrence.
[85] For 1946.
[86] For 1950. Estimated rate, based on reports for 21 municipalities in which registration is believed to be complete.
[87] Excluding Indian jungle population, estimated at 350 000 in 1940.
[88] Excluding Indian and Negro population living in tribes, estimated at 22 000 in 1945, 26 000 in 1946-1958 and 38 000 in 1959.
[89] Excluding Indian jungle population, numbering 56 705 in 1950 and estimated at 31 800 in 1961.
[90] Excluding dependencies.
[91] Estimated rate; basis unknown.
[92] Data are for a changing number of towns having a present population of approximately 2 million.
[93] For year ended April 1959. Estimate, based on results of 1958-1959 demographic sample survey in 345 villages.
[94] Birth registration estimated to be 88 per cent complete in 1953, according to results of post-censal sample survey.

[82] D'après les baptêmes inscrits sur les registres de l'Eglise catholique romaine.
[83] Il n'est pas tenu compte des Indiens de la jungle. Non compris les décès survenus dans les îles Galapagos, pour les années antérieures à 1955, ni dans les provinces de Napo Pastaza, de Morona Santiago et de Zamora Chinchipe, pour les années antérieures à 1954; toutefois, les taux ont été calculés sur la base de la population totale.
[84] 1956: L'enregistrement saisirait environ 70 pour 100 des naissances. Pour les années antérieures à 1954, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[85] 1946.
[86] 1950. Taux estimatif obtenu à partir des données fournies par 21 municipalités où l'on pense que l'enregistrement est complet.
[87] Non compris les Indiens de la jungle, au nombre de 350 000 en 1940 (estimation).
[88] Non compris les noirs et les Indiens vivant en tribus: 22 000 personnes en 1945, 26 000 en 1946-1958 et 38 000 en 1959.
[89] Non compris les Indiens de la jungle, au nombre de 56 705 en 1950 et estimés à 31 800 en 1961.
[90] Non compris les dépendances.
[91] Taux estimatif; base inconnue.
[92] Les données se rapportent à un nombre variable de villes qui comptent actuellement 2 millions d'habitants environ.
[93] Période annuelle se terminant en avril 1959. Estimation établie sur la base des résultats d'une enquête démographique par sondage effectuée en 1958-1959 dans 345 villages.
[94] Un sondage de vérification postcensitaire a permis d'établir que 88 pour 100 des naissances ont été enregistrés en 1953.

6. Live births and crude birth rates (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[3] Data exclude live-born infants dying before registration of birth.
[4] Four-year average.
[5] Three-year average.
[10] Rate(s) not computed by the Statistical Office of the United Nations.
[13] Two-year average.
[18] For 1955.
[37] For 1949.
[95] Rates are estimated, based on results of surveys and reports from areas where registration is considered satisfactory. Released by State Statistical Bureau, Peking, 1958.
[96] Excluding armed forces and, beginning 1949, foreigners.
[97] Beginning 1955, data are estimates based on experience of 1952-1954.
[98] Rates computed on population excluding armed forces.
[99] Estimated average annual rate for 1941-51, based on demographic analysis of 1941 and 1951 census returns.
[100] Estimated rate for rural India; for 1953, based on 7th round and for 1958 on 14th round of National Sample Survey. Rate given for 1955-59 is for 1958 only.
[101] Data are for a changing group of states and territories which, in 1959, included a population of about 382 million.
[102] Birth registration completeness for individual states varied between 65 and over 90 per cent for the period 1951-1955.
[103] For 1950 and 1953-54. Estimated rate; basis unknown. For 1953-54, rate is "40 or more".
[104] Data are for a changing number of regencies in Java which in 1959 included a population of about 54 million.
[105] Estimated average annual rate for Java for 1953-57, based on data for selected regencies where registration is believed to be fairly complete. Recorded rates for 1953-1957 are 29.8, 31.9, 30.7, 26.3 and 29.1, respectively.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[3] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[4] Moyenne pour quatre ans.
[5] Moyenne pour trois ans.
[10] Le calcul de ce(s) taux n'a pas été fait au Bureau de statistique des Nations Unies.
[13] Moyenne pour deux ans.
[18] 1955.
[37] 1949.
[95] Taux estimatifs calculés à partir des rapports et résultats d'enquêtes concernant des zones où l'enregistrement est considéré comme satisfaisant. Source: Direction des statistiques, Pékin, 1958.
[96] Non compris les militaires et, à partir de 1949, non compris les étrangers.
[97] A partir de 1955, estimation fondée sur les résultats d'une évaluation concernant les données pour 1952-1954.
[98] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires.
[99] Taux annuel moyen estimatif pour 1941-51 obtenu à partir des résultats de l'analyse démographique des recensements de 1941 et de 1951.
[100] Taux estimatif concernant la population rurale de l'Inde; ce taux a été obtenu à partir des résultats des 7ème et 14ème phases de l'Enquête nationale par sondage. Le taux indiqué pour 1955-59 ne se rapporte qu'à 1958.
[101] Les données se rapportent à un groupe variable d'Etats et de territoires qui, en 1959, comptaient 382 millions d'habitants environ.
[102] La complétude de l'enregistrement des naissances dans les divers Etats a varié entre 65 et plus de 90 pour 100 en 1951-1955.
[103] 1950 et 1953-54. Taux estimatif; base inconnue. 1953-54, le taux est de "40 ou plus".
[104] Les données se rapportent à un groupe variable de régences de Java qui, en 1959, comptaient 54 millions d'habitants environ.
[105] Taux estimatif pour 1953-57 calculé d'après des données relatives à certaines régences où l'on pense que l'enregistrement est relativement complet. Pour les années 1953-1957, les taux établis d'après les données d'enregistrement sont de 29,8; 31,9; 30,7; 26,3 et 29,1, respectivement.

6. Naissances vivantes et taux bruts de natalité (suite)

[Voir note au début du tableau.]

[106] Prior to 1952, data are for years ended 20 March. Beginning 1952, data are for years ended 21 December. In 1954, births registered in year of occurrence accounted for 59 per cent of total births registered.

[107] Estimated rate, based on demographic analysis of results of 1956 census of population and subsequent national sample survey in 40 towns and 300 villages. Recorded rates for 1956-1959 are 34.8, 39.6, 42.8 and 44.3, respectively.

[108] Prior to 1957 and for 1961, excluding Bedouin population in the Negev.

[109] For Jewish population only.

[110] Data are for Japanese nationals in Japan only. Prior to May 1952, excluding Takara Archipelago and prior to 1954, Amami Islands, both acquired from the Ryukyu Islands on 5 December 1951 and 25 December 1953, respectively.

[111] Excluding foreigners but including registered Palestinian refugees. For number of refugees, see Table 4.

[112] Birth registration estimated to be about 80 per cent complete in 1955.

[113] Excluding alien armed forces, civilian aliens employed by armed forces, and foreign diplomatic personnel.

[114] Excluding non-resident foreigners and registered Palestinian refugees. For number of refugees, see Table 4.

[115] Data include late foetal deaths.

[116] Shown formerly as Mongolian People's Republic.

[117] Estimated rate, based on demographic analysis of 1952-54 population census returns. Rate given for 1950-54 is for 1952-54 only.

[118] For 1947.

[119] Data are for a changing registration area which in 1951 comprised about 90 per cent of total population.

[119a] Prior to 1951, data tabulated by year of occurrence.

[120] Beginning July 1954, excluding births in *concelho* of Nagar-Aveli (population 41 532 in 1950) but rates computed on total population.

[121] Prior to 1948, data include late foetal deaths.

[122] Registration believed to be complete for civilized population only, which represents a relatively small proportion of the total.

[106] Pour les années antérieures à 1952, les taux se rapportent à des périodes annuelles se terminant le 20 mars. A partir de 1952, les taux se rapportent à des périodes annuelles se terminant le 21 décembre. Les naissances enregistrées selon l'année de l'événement en 1954 représentent 59 pour 100 du total des naissances inscrites.

[107] Taux estimatif obtenu à partir des résultats de l'analyse démographique du recensement de population de 1956 et d'une enquête nationale par sondage effectuée dans 40 villes et 300 villages. Pour les années 1956-1959, les taux établis d'après les données d'enregistrement sont de 34,8; 39,6; 42,8 et 44,3, respectivement.

[108] Pour les années antérieures à 1957 et, pour 1961, non compris les Bédouins du Négeb.

[109] Population juive.

[110] Ne concerne que les nationaux japonais se trouvant au Japon. Pour la période antérieure à mai 1952, non compris l'archipel des Tokara et, pour les années antérieures à 1954, les îles Amami, détachés des îles Ryû-kyû et rattachés au Japon le 5 décembre 1951 et le 25 décembre 1953, respectivement.

[111] Non compris les étrangers, mais y compris les réfugiés de Palestine immatriculés. Pour leur nombre, voir le tableau 4.

[112] 1955: l'enregistrement saisirait environ 80 pour 100 des naissances.

[113] Non compris les militaires étrangers, les civils étrangers employés par les forces armées et les membres du corps diplomatique étranger.

[114] Il n'est pas tenu compte des naissances survenues parmi les étrangers non résidents et parmi les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 4.

[115] Y compris les morts fœtales tardives.

[116] Anciennement désignée sous le nom de République populaire mongole.

[117] Taux estimatif obtenu à partir des résultats de l'analyse démographique du recensement de population de 1952-54. Le taux figurant dans la colonne 1950-54 ne se rapporte qu'à la période 1952-54.

[118] 1947.

[119] Les données se rapportent à une zone d'enregistrement qui varie selon les années et qui comprenait en 1951 environ 90 pour 100 de la population totale.

[119a] Antérieurement à 1951 données calculées selon l'année de l'événement.

[120] A partir de juillet 1954, non compris les naissances survenues dans le *concelho* de Nagar-Aveli (population estimée à 41 532 en 1950); toutefois les taux ont été calculés sur la base de la population totale.

[121] Pour les années antérieures à 1948, y compris les morts fœtales tardives.

[122] L'enregistrement ne serait complet que pour la population "civilisée", qui représente une fraction relativement faible de la population totale.

6. Live births and crude birth rates (continued)

Italics: Data are unreliable or of unknown completeness.

* Provisional.

† Data tabulated by year of registration rather than occurrence.

[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.

[3] Data exclude live-born infants dying before registration of birth.

[4] Four-year average.

[5] Three-year average.

[10] Rate(s) not computed by the Statistical Office of the United Nations.

[13] Two-year average.

[20] For 1954.

[85] For 1946.

[98] Rates computed on population excluding armed forces.

[123] Excluding Allied military and civilian personnel and their dependants stationed in the area.

[124] Registration estimated to be about 88 per cent complete in 1955; prior to 1955, data are tabulated by year of registration rather than occurrence.

[125] Birth registration believed to be about 80 per cent complete in 1951.

[126] Estimated rate, based on results of 6.2 per cent sample survey of population of 1 700 villages. Rate given for 1950-54 is for 1954 only.

[127] Rates computed on population excluding transients afloat and non-locally domiciled military and civilian services personnel and their dependants.

[128] Prior to 1953, data are tabulated by year of registration rather than by year of occurrence.

[129] Formerly Syrian Region of United Arab Republic; reverted to status of independent nation 29 September 1961. Excluding Palestinian refugees, numbering 124 261 on 1 July 1960; for number excluded 1950-1959, see Table 4. Data exclude also nomads, estimated at 179 722 at end 1956, but rates computed on population including them.

[130] Data are live births registered within one month of occurrence; additional late registrations made during year for 1956-1960 numbered 25 758, 30 021, 172 315, 130 801 and 83 809, respectively.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.

[3] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.

[4] Moyenne pour quatre ans.

[5] Moyenne pour trois ans.

[10] Le calcul de ce(s) taux n'a pas été fait au Bureau de statistique des Nations Unies.

[13] Moyenne pour deux ans.

[20] 1954.

[85] 1946.

[98] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires.

[123] Non compris les militaires et agents civils alliés en poste sur le territoire ni les membres de leur famille les accompagnant.

[124] 1955: l'enregistrement ne saisirait que 88 pour 100 environ des naissances; pour les années antérieures à 1955, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[125] 1951: l'enregistrement ne saisirait que 80 pour 100 environ des naissances.

[126] Taux estimatif obtenu à partir des résultats d'une enquête par sondage portant sur 6,2 pour 100 de la population répartie dans 1 700 villages. Le taux figurant dans la colonne 1950-54 se rapporte à 1954 seulement.

[127] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les personnes de passage à bord de navires, ni les militaires et les agents civils domiciliés en dehors du territoire, ni les membres de leur famille les accompagnant.

[128] Pour les années antérieures à 1953, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[129] Ancienne Région syrienne de la République arabe unie, redevenue Etat indépendant le 29 septembre 1961. Non compris les réfugiés de Palestine, au nombre de 124 261 au 1er juillet 1960; pour le nombre des réfugiés omis chaque année de 1950 à 1959, voir le tableau 4. Non compris la population nomade, soit 179 722 personnes à la fin de 1956; toutefois, les taux sont calculés sur la base d'un chiffre de population les comprenant.

[130] Les données représentent les naissances vivantes enregistrées dans le mois qui suit l'événement; le nombre des autres naissances qui ont fait l'objet d'un enregistrement tardif s'établit, pour chaque année de 1956 à 1960, comme suit: 25 758, 30 021, 172 315, 130 801 et 83 809, respectivement.

6. Naissances vivantes et taux bruts de natalité (suite)

[Voir note au début du tableau.]

[131] Estimated average annual rate for 1947-56, based on demographic analysis of results of 1947 population census and 1956 Demographic and Economic Survey of Thailand. Recorded rate for 1956 is 37.4.

[132] Data are for changing territory representing 61 per cent of total population in 1954 and 97 per cent in 1957.

[133] Rates computed on population excluding armed forces in Guernsey and dependencies.

[134] Beginning 1953, data exclude those infants born alive after less than 28 weeks' gestation, of less than 1 000 grammes in weight and 35 centimetres in length, who die within 24 hours of birth.

[135] Excluding Greenland and Faeroe Islands, shown separately.

[136] For 1945-1948, excludes data for civilian aliens living in Denmark without residence permits, numbering 200 000 in 1945 and 2 500 at end of 1948.

[137] Prior to 1951, data are for Finnish nationals in Finland only, except that for 1950 rate is computed on population which includes resident aliens; beginning 1951, including also data for nationals temporarily outside country.

[138] Data include births among alien armed forces stationed in the area and among national armed forces wherever stationed, but rates are computed on population excluding alien armed forces and members of career military service outside country, unless on duty in Germany and Austria.

[139] For 1945, excludes Department of Bas-Rhin, Haut-Rhin and Moselle.

[140] Including residents of the Federal Republic of Germany temporarily in West Berlin and excluding alien armed forces and non-resident civilians temporarily in the area.

[141] For 1946-1947, excludes births among aliens in the former Saar.

[142] Including residents of West Berlin temporarily in the Federal Republic of Germany and excluding alien armed forces and non-resident civilians temporarily in the area.

[131] Taux annuel moyen estimatif pour 1947-56 obtenu à partir des résultats de l'analyse démographique du recensement de population de 1947 et de l'Enquête démographique et économique thaïlandaise de 1956. Le taux correspondant calculé d'après les données de l'enregistrement est de 37,4 et se rapporte à 1956.

[132] Les données se rapportent à des zones variables comptant 61 pour 100 et 97 pour 100 de la population totale en 1954 et 1957, respectivement.

[133] Taux calculés sur la base d'un chiffre de population ne comprenant pas les militaires en garnison à Guernesey et dans ses dépendances.

[134] A partir de 1953, il n'est pas tenu compte des enfants nés vivants après moins de 28 semaines de gestation, pesant moins de 1 000 grammes, mesurant moins de 35 centimètres et décédés dans les 24 heures qui ont suivi la naissance.

[135] Non compris le Groenland et les îles Féroé, qui font l'objet de rubriques distinctes.

[136] 1945-1948: non compris les civils étrangers résidant au Danemark sans permis de séjour, au nombre de 200 000 en 1945 et de 2 500 à la fin de 1948.

[137] Pour les années antérieures à 1951, les données ne concernent que les nationaux finlandais se trouvant en Finlande, mais pour 1950 le taux est calculé sur la base d'un chiffre de population comprenant les résidents étrangers; à partir de 1951, y compris les nationaux finlandais se trouvant temporairement hors de Finlande.

[138] Y compris les militaires étrangers en garnison sur le territoire et les militaires français où qu'ils soient en garnison; cependant, les militaires étrangers dans le pays et les militaires français de carrière en garnison hors du pays, à l'exception de ceux qui font partie des forces d'occupation en Allemagne et en Autriche, ne sont pas compris, pour le calcul des taux, dans le chiffre de population auquel est rapporté le nombre des naissances.

[139] 1945: non compris les départements du Bas-Rhin, du Haut-Rhin et de la Moselle.

[140] Y compris les résidents de la République fédérale d'Allemagne se trouvant temporairement à Berlin-Ouest mais non compris les membres des familles des militaires étrangers et des civils non résidents se trouvant temporairement à Berlin-Ouest.

[141] 1946-1947: non compris les étrangers se trouvant sur l'ancien territoire de la Sarre.

[142] Y compris les résidents de Berlin-Ouest se trouvant temporairement dans la République fédérale d'Allemagne, mais non compris les membres des familles des militaires étrangers et des civils non résidents se trouvant temporairement à Berlin-Ouest.

6. Live births and crude birth rates (continued)

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[4] Four-year average.
[5] Three-year average.
[13] Two-year average.
[15] For 1953.
[16] For 1959.
[20] For 1954.
[37] For 1949.
[62] Prior to 1956, data tabulated by year of registration rather than occurrence.
[115] Data include late foetal deaths.
[143] Rates computed on population including armed forces stationed outside country and excluding alien armed forces stationed in the area.
[144] Data are births registered within one year of occurrence.
[145] Prior to 1951, rates computed on population including armed forces and civilians stationed outside country.
[146] Rates computed on population excluding non-Maltese armed forces stationed in the area but, beginning 1957, including civilian nationals temporarily outside country.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[4] Moyenne pour quatre ans.
[5] Moyenne pour trois ans.
[13] Moyenne pour deux ans.
[15] 1953.
[16] 1959.
[20] 1954.
[37] 1949.
[62] Pour les années antérieures à 1956, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[115] Y compris les morts fœtales tardives.
[143] Taux calculés sur la base d'un chiffre de population qui comprend les militaires nationaux hors du pays, mais non les militaires étrangers en garnison sur le territoire.
[144] Naissances enregistrées dans l'année qui suit l'événement.
[145] Pour les années antérieures à 1951, taux calculés sur la base d'un chiffre de population qui comprend les militaires et les civils nationaux en poste hors du territoire.
[146] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires non maltais en garnison sur le territoire mais qui, à partir de 1957 comprend les civils nationaux temporairement hors du pays.

6. Naissances vivantes et taux bruts de natalité (suite)

[147] Including residents outside country if listed in a Netherlands population register. Prior to 1959, excluding Amboynese living in camps.

[148] Data include upward adjustment to cover deficiency of 1.0-1.4 per cent in registration.

[149] Data tabulated by year of occurrence for England and Wales and by year of registration for Northern Ireland and Scotland.

[150] Computed on population including armed forces outside country and merchant seamen at sea but excluding Commonwealth and foreign armed forces within country.

[151] Computed on population including merchant seamen at sea for England and Wales in 1950.

[152] Excluding full-blooded aborigines, estimated at 39 319 in June 1954.

[153] Prior to 1958, data are for years ended 31 March.

[154] Including data for the condominium of Canton and Enderbury, not available separately.

[155] For 1947 and 1949. Computed on population excluding United States military personnel, their dependants and contract employees.

[156] Data are live-births for years ended 30 June but rates computed on population for years ended 31 December of the previous year.

[147] Y compris les résidents se trouvant hors du territoire, s'ils sont inscrits sur un registre de population néerlandais. Pour les années antérieures à 1959, non compris les Amboinais vivant dans des camps.

[148] Compte tenu d'un ajustement destiné à compenser les lacunes de l'enregistrement (1,0-1,4 pour 100).

[149] Les données sont exploitées selon l'année de l'événement pour l'Angleterre et le Pays de Galles et selon l'année de l'enregistrement pour l'Irlande du Nord et l'Ecosse.

[150] Calcul effectué sur la base d'un chiffre de population qui comprend les équipages de la marine marchande en mer, mais non les militaires du Commonwealth ni les militaires étrangers dans le pays.

[151] Calcul effectué sur la base d'un chiffre de population qui, pour l'Angleterre et le Pays de Galles, en 1950, comprend les équipages de la marine marchande en mer.

[152] Non compris les aborigènes purs, au nombre de 39 319 (estimation) en juin 1954.

[153] Pour les années antérieures à 1958, les données se rapportent à des périodes annuelles se terminant le 31 mars.

[154] Y compris le Condominium de Canton et Enderbury.

[155] 1947 et 1949. Taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires des Etats-Unis et les membres de leur famille les accompagnant, ni les agents contractuels des Etats-Unis.

[156] Les données se rapportent à des périodes annuelles se terminant le 30 juin mais les taux sont calculés sur la base d'un chiffre de population qui se rapporte à des périodes annuelles se terminant le 31 décembre de l'année précédente.

6. Live births and crude birth rates (continued)

[158] Excluding United States military personnel, their dependants and contract employees. For 1950-1952, excluding Rota. For 1954, excluding Rota and outlying islands of the Yap district.

[159] Prior to 1953, data are tabulated by year of registration rather than by year of occurrence.

[160] Beginning 1953, data are for Tongan population only. For 1958-1960, rates are computed on total population.

[161] Prior to 1951, rates based on births for years ended 31 March and computed on population for years ended 30 September of previous year. For 1951, data are for Samoan population only and, prior to 1954, include late foetal deaths among Samoan population.

[158] Non compris les militaires des Etats-Unis et les membres de leur famille les accompagnant, ni les agents contractuels des Etats-Unis. 1950-1952: non compris Rota. 1954: Non compris Rota, ni les îles périphériques du district de Yap.

[159] Pour les années antérieures à 1953, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[160] A partir de 1953, Tongans seulement. 1958-1960: Taux calculés sur la population totale.

[161] Pour les années antérieures à 1951, taux calculés sur la base d'un chiffre de naissances qui se rapporte à des périodes annuelles se terminant le 31 mars et d'un chiffre de population qui se rapporte à des périodes annuelles se terminant le 30 septembre de l'année précédente. 1951: Samoans seulement. Pour les années antérieures à 1954, y compris les morts fœtales tardives survenues parmi les Samoans.

7. Live births by age of mother : latest available year
Naissances vivantes selon l'âge de la mère : dernière année disponible

[Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 27. — Les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 78.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[2] Data exclude live-born infants dying before registration of birth.
[13] Excluding data for Canal Zone, shown separately above; also excluding tribal Indian population, numbering *60 540 in 1960.
[14] Data are based on a 50 per cent sample of recorded births.
[15] Excluding Hawaii.
[16] Excluding Amerindians.
[17] Data are baptisms recorded in Roman Catholic church registers.
[18] Excluding Indian jungle population.
[19] Data are for an area covered by 44 Health Units and 76 Health "Posts", which is not representative of Paraguay and for which population is not available.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données classées selon l'année de l'enregistrement et non l'année de l'événement.
[2] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[13] Non compris la Zone du Canal qui fait l'objet d'une rubrique distincte (voir plus haut), et les Indiens vivant en tribus (*60 540 en 1960).
[14] D'après un échantillon de 50 pour 100 des naissances enregistrées.
[15] Non compris Hawaii.
[16] Non compris les Amérindiens.
[17] Baptêmes inscrits sur les registres de l'Eglise catholique romaine.
[18] Non compris les Indiens de la jungle.
[19] Les données se rapportent à une zone desservie par 44 centres sanitaires et 76 postes sanitaires, qui n'est pas représentative du Paraguay et dont la population n'est pas connue.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[2] Data exclude live-born infants dying before registration of birth.
[11] Data are confinements resulting in live births.
[20] Excluding Indian jungle population, estimated at 350 000 in 1940.
[21] Excluding Indian jungle population, numbering 56 705 in 1950.
[22] For year ended April 1959. Data are estimates, based on results of 1958-1959 demographic sample survey in 345 villages.
[23] Excluding armed forces and foreigners.
[24] Data are confinements resulting in live births, of which 6 were cases of triplets and 1 354 of twins.
[25] Data are estimates of confinements resulting in live births, based on experience of 1952-1954.
[26] Data are for 39 towns, having a population of over 100 000 each.
[27] Data are for Japanese nationals in Japan only.
[28] Excluding alien armed forces, civilian aliens employed by armed forces and foreign diplomatic personnel.
[29] Territory formerly under British mandate.
[30] Data are for settled Moslem population and are confinements resulting in live births or late foetal deaths.
[31] Data are reports received from only 84 per cent of local civil registrars.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données classées selon l'année de l'enregistrement et non l'année de l'événement.
[2] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[11] Les données représentent le nombre d'accouchements d'enfants vivants.
[20] Non compris les Indiens de la jungle au nombre de 350 000 en 1940 (estimation).
[21] Non compris les Indiens de la jungle (56 705 en 1950).
[22] Période annuelle se terminant en avril 1959. Estimation établie sur la base des résultats d'une enquête démographique par sondage effectuée en 1958-1959 dans 345 villages.
[23] Non compris les militaires et les étrangers.
[24] Les données représentent le nombre d'accouchements d'enfants vivants, dont 6 triplés et 1 354 issus d'accouchements doubles.
[25] Les données représentent le nombre d'accouchements d'enfants vivants d'après l'expérience de 1952-1954.
[26] Les données se rapportent à 39 villes de plus de 100 000 habitants.
[27] Ne concerne que les nationaux japonais se trouvant au Japon.
[28] Non compris les militaires et les civils étrangers employés par les militaires et le personnel du corps diplomatique étranger.
[29] Ancien territoire sous mandat britannique.
[30] Les données concernent la population musulmane sédentaire et représentent des accouchements d'enfants vivants ou des morts fœtales tardives.
[31] D'après les rapports reçus de 84 pour 100 seulement des bureaux d'état civil.

Italics: Data are unreliable or of unknown completeness.

† Data tabulated by year of registration rather than occurrence.

[2] Data exclude live-born infants dying before registration of birth.

[6] Age classification based on difference between year of birth of mother and year of birth of child.

[32] Excluding Allied military and civilian personnel and their dependants stationed in the area.

[33] Excluding non-locally domiciled military and civilian services personnel and their dependants.

[34] Data exclude those infants born alive after less than 28 weeks' gestation, of less than 1 000 grammes in weight and 35 centimetres in length, who die within 24 hours of birth.

[35] Excluding Greenland and Faeroe Islands, shown separately.

[36] Including nationals temporarily outside country.

[37] Including armed forces and their dependants outside country.

[38] Including data for East Berlin. Data include late foetal deaths, numbering 4 790.

[39] Including residents of the Federal Republic of Germany temporarily in West Berlin and excluding alien armed forces and non-resident civilians temporarily in the area.

[40] Including residents of West Berlin temporarily in the Federal Republic of Germany and excluding alien armed forces and non-resident civilians temporarily in the area.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

† Données classées selon l'année de l'enregistrement et non l'année de l'événement.

[2] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.

[6] La classification selon l'âge est obtenue en faisant la différence entre l'année de naissance de la mère et celle de l'enfant.

[32] Non compris les militaires et le personnel civil alliés et les personnes à leur charge en poste sur le territoire.

[33] Non compris les militaires et le personnel civil non domicilié ainsi que les personnes à leur charge.

[34] Il n'est pas tenu compte des enfants nés vivants après moins de 28 semaines de gestation, pesant moins de 1 000 grammes, mesurant moins de 35 centimètres et décédés dans les 24 heures qui ont suivi la naissance.

[35] Non compris le Groenland et les îles Féroé qui font l'objet de rubriques distinctes.

[36] Y compris les nationaux du pays temporairement à l'étranger.

[37] Y compris les militaires et leur famille se trouvant à l'étranger.

[38] Y compris Berlin-Est et les morts fœtales tardives au nombre de 4 790.

[39] Y compris les naissances survenues parmi les résidents de la République fédérale d'Allemagne se trouvant temporairement à Berlin-Ouest et non compris celles qui se sont produites dans les familles des militaires étrangers et des civils non résidents se trouvant temporairement dans la République fédérale d'Allemagne.

[40] Y compris les naissances survenues parmi les résidents de Berlin-Ouest temporairement dans la République fédérale d'Allemagne mais non compris celles qui se sont produites dans les familles des militaires étrangers et des civils non résidents se trouvant temporairement à Berlin-Ouest.

Italics: Data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
[4] Data exclude live-born infants dying within 24 hours of birth.
[6] Age classification based on difference between year of birth of mother and year of birth of child.
[41] Data are births registered within one year of occurrence.
[42] Including residents outside country if listed in a Netherlands population register.
[43] For age groups "under 16 years" and "16-19", as appropriate.
[44] Births for which age of mother was not stated, numbering 1 253, have been distributed according to known age proportions.
[45] Excluding full-blooded aborigines, estimated at 39 319 in June 1954.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
† Données classées selon l'année de l'enregistrement et non l'année de l'événement.
[4] Non compris les enfants nés vivants décédés dans les 24 heures qui ont suivi leur naissance.
[6] La classification selon l'âge est obtenue en faisant la différence entre l'année de naissance de la mère et celle de l'enfant.
[41] Naissances enregistrées dans l'année suivant l'événement.
[42] Y compris les résidents hors du territoire s'ils sont inscrits sur un registre de population néerlandais.
[43] Pour les groupes "moins de 16 ans" et "16-19 ans" selon le cas.
[44] 1 253 naissances pour lesquelles l'âge de la mère n'a pas été déclaré, ont été réparties selon la structure par âge considérée comme normale en l'occurrence.
[45] Non compris les aborigènes purs, au nombre de 39 319 (estimation) en juin 1954.

7. Live births by age of mother (continued) — Naissances vivantes selon l'âge de la mère (suite)

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[46] Excluding Saipan; also excluding United States military personnel, their dependants and contract employees stationed in the area.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données classées selon l'année de l'enregistrement et non l'année de l'événement.
[46] Non compris Saipan, et non compris les militaires américains et leur famille et les employés contractuels américains en poste sur le territoire.

8. Late foetal deaths 1952-1960 and late foetal death ratios, 1945-59 and 1952-1960

["Late foetal deaths" are those of at least 28 weeks' gestation. Foetal deaths of unknown gestational age are included. Ratios are the number of late foetal deaths per 1 000 live births. Reliability and comparability of data known to be greatly affected by incomplete or irregular registration of foetal deaths, and/or live births, and by variations in definitions. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 28.]

Italics: Data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[2] Including the two Departments of the Sahara.
[3] Live-born infants dying before registration of birth are included among late foetal deaths but are excluded from live births used in the computation of ratios.
[3a] Computed on number of baptisms recorded in church registers.
[4] Three-year average. [5] For 1947.
[6] Two-year average.
[7] Data are for a compulsory registration area of 36 towns and townships, which comprise about 12 per cent of total population and are not representative of Ghana.
[8] Not computed by the Statistical Office of the United Nations.
[9] Four-year average.
[10] For 1950.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
† Données classées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[2] Y compris les deux départements du Sahara.
[3] Il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre des morts fœtales tardives, mais non celui des naissances vivantes qui sert au calcul des rapports.
[3a] Taux calculés d'après le nombre de baptêmes inscrits sur les registres des églises.
[4] Moyenne pour 3 ans. [5] 1947.
[6] Moyenne pour 2 ans.
[7] Données se rapportant à une zone où l'enregistrement est obligatoire; cette zone se compose de 36 villes et municipalités comptant 12 pour cent environ de la population totale et n'est pas représentative de l'ensemble du Ghana.
[8] Le calcul n'a pas été fait par le Bureau de statistique de l'ONU.
[9] Moyenne pour 4 ans.
[10] 1950.

8. Morts fœtales tardives 1952-1960 et rapports de mortinatalité 1945-59 et 1952-1960

[Les "morts fœtales tardives" sont celles qui surviennent après 28 semaines de gestation au moins. Les données du présent tableau comprennent les morts fœtales survenues après une gestation de durée inconnue. Les rapports représentent le nombre de morts fœtales tardives pour 1 000 naissances vivantes. La qualité et la comparabilité des données sont considérablement réduites en raison de l'enregistrement incomplet ou irrégulier des morts fœtales et/ou des naissances vivantes, et du manque d'uniformité dans les définitions. Les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et les insuffisances des données, voir Notes Techniques, page 79.]

[11] Northern part of former Spanish Protectorate.
[12] Live-born infants dying within 24 hours of birth are included among late foetal deaths but are excluded from live births used in computation of ratios.
[13] For 1955.
[14] The former French Protectorate.
[15] Population which has fulfilled certain conditions established by law, i.e., achieved a prescribed degree of material and social development as measured by educational level, language used and mode of living.
[16] Prior to 1956, data are for indigenous population only.
[17] Data are deaths of foetuses of 6 or more months' gestation.
[18] Former British dependency; declared independent 27 April 1961.
[19] For Freetown only.
[20] For 1956.
[21] Prior to 31 May 1961, known as Union of South Africa.
[22] Prior to 1958, including data for the southern part of former Spanish Protectorate of Morocco, transferred to Morocco on 10 April 1958.

[11] Partie nord de l'ancien Protectorat espagnol.
[12] Il est tenu compte des enfants nés vivants décédés dans les 24 heures pour établir le nombre des morts fœtales tardives mais non celui des naissances vivantes qui sert aux calculs des rapports.
[13] 1955.
[14] Ancien Protectorat français.
[15] Population remplissant certaines conditions fixées par la loi, c'est-à-dire ayant atteint un degré de développement matériel et social déterminé du point de vue du niveau d'instruction, de la langue parlée et du mode de vie.
[16] Pour les années antérieures à 1956, les données se rapportent à la population indigène seulement.
[17] Morts fœtales survenues après 6 mois de gestation au moins.
[18] Ancienne possession britannique, proclamée indépendante le 27 avril 1961.
[19] Freetown seulement.
[20] 1956.
[21] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.
[22] Pour les années antérieures à 1958, y compris la partie sud de l'ancien Protectorat espagnol du Maroc, cédée au Maroc le 10 avril 1958.

8. Late foetal deaths and late foetal death ratios (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[4] Three-year average.
[6] Two-year average.
[9] Four-year average.
[17] Data are deaths of foetuses of 6 or more months' gestation.
[23] For 1959.
[24] Between 21 February 1958 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only. Data are for the former Egyptian Region.
[25] For localities having Health Bureaux, which comprised 4.4 per cent of total population in 1958.
[26] Excluding tourists and United Kingdom and United States armed forces and their dependants stationed in the area.
[27] Prior to 1956, data tabulated by year of registration rather than occurrence.
[28] Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.
[29] For deaths of foetuses of 5 or more months' gestation.
[30] Except for 1955 and 1957-1960, data are foetal deaths irrespective of gestational age. For 1945, ratios computed on live births tabulated by year of registration; beginning 1946, on live births tabulated by year of occurrence but registered during the period 1946-1960. For completeness of birth registration, see Table 6.
[31] Prior to 1952, ratios computed on live births tabulated by date of occurrence.
[32] Prior to 1951, data tabulated by year of registration rather than occurrence.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données classées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[4] Moyenne pour 3 ans.
[6] Moyenne pour 2 ans.
[9] Moyenne pour 4 ans.
[17] Morts fœtales survenues après 6 mois de gestation au moins.
[23] 1959.
[24] 21 février 1958-29 septembre 1961: Région égyptienne et Région syrienne. A partir du 29 septembre 1961, ancienne Région égyptienne seulement. Données se rapportent à l'ancienne Région égyptienne.
[25] Données concernant les localités dotées d'un bureau d'hygiène, qui comprenaient 4,4 pour 100 de la population totale en 1958.
[26] Non compris les touristes et les militaires du Royaume-Uni et des Etats-Unis en garnison sur le territoire et les membres de leur famille les accompagnant.
[27] Pour les années antérieures à 1956, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[28] Y compris les résidents canadiens se trouvant temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis se trouvant temporairement au Canada.
[29] Morts fœtales survenues après 5 mois de gestation au moins.
[30] Sauf pour 1955 et 1957-1959, ensemble des morts fœtales quelle que soit la durée de gestation. Pour 1945 rapports calculés sur la base des naissances vivantes, classées selon l'année de l'enregistrement; à partir de 1946, rapports calculés sur la base des naissances vivantes classées selon l'année de l'événement mais enregistrées au cours de la période 1946-1960.
[31] Pour les années antérieures à 1952, données calculées sur la base des naissances vivantes classées selon l'année de l'événement.
[32] Pour les années antérieures à 1951, données calculées selon l'année de l'enregistrement et non l'année de l'événement.

8. Morts fœtales tardives et rapports de mortinatalité (suite)

[Voir note au début du tableau.]

[33] Live-born infants dying before registration of birth are included among late foetal deaths but are excluded from live births used in computation of ratios. For 1951-1957 and 1959, infants known to have breathed numbered 52, 65, 57, 54, 59, 58, 57 and 68, respectively; those whose ability to breathe was not reported numbered 207, 81, 194, 198, 193, 160, 64 and 74, respectively.

[34] Registration estimated to be only 25-30 per cent complete.

[35] Live-born infants dying before registration of birth are included among late foetal deaths but are excluded from live births used in the computation of ratios. For 1951-1959, infants known to have breathed numbered 86, 86, 86, 73, 74, 55, 60, 52 and 56, respectively; those whose ability to breathe was not reported numbered 182, 121, 84, 106, 104, 89, 154, 126 and 98, respectively.

[36] Data include deaths of foetuses of less than 28 weeks' gestation.

[37] For 1952 and 1953, data are for Aruba, Bonaire and Curaçao only.

[38] Except for Curaçao since 1957, live-born infants dying before registration of birth are included among late foetal deaths but are excluded from live births used in computation of ratios. Beginning 1952, ratios computed on live births which include those among residents outside the country if listed in Netherlands Antilles population register.

[39] Data are all foetal deaths irrespective of gestational age, although compulsory registration is required only for deaths of foetuses of 28 or more weeks' gestation.

[40] Excluding data for Canal Zone, shown separately above; also excluding tribal Indian population, numbering 48 654 in 1950 and *60 540 in 1960.

[41] Data are deaths of foetuses of 5 or more months' gestation. Ratios for deaths of foetuses of 28 or more weeks' gestation are as follows: 1947-49, *10.5, 1950-51, *13.1, 1958-59, 22.6 and 1960, 24.1.

[42] For 1959, excludes data for Hawaii.

[43] Prior to 1954, data tabulated by year of registration rather than occurrence.

[33] Il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre des morts fœtales tardives mais non celui des naissances vivantes qui sert au calcul des rapports. Pour 1951-1957 et 1959, le nombre d'enfants dont on sait qu'ils ont respiré s'établit à 52, 65, 57, 54, 59, 58, 57 et 68 respectivement; pour ceux dont on ignore s'ils ont respiré, les chiffres correspondants sont 207, 81, 194, 198, 193, 160, 64 et 74 respectivement.

[34] La complétude de l'enregistrement est estimée à 25 ou 30 pour cent seulement.

[35] Il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre des morts fœtales tardives mais non celui des naissances vivantes qui sert au calcul des rapports. Pour 1951-1959, le nombre d'enfants dont on sait qu'ils ont respiré s'établit à 86, 86, 86, 73, 74, 55, 60, 52 et 56 respectivement; pour ceux dont on ignore s'ils ont respiré les chiffres correspondants sont 182, 121, 84, 106, 104, 89, 154, 126 et 98 respectivement.

[36] Morts fœtales survenues après moins de 28 semaines de gestation.

[37] 1952 et 1953, Aruba, Bonaire et Curaçao seulement.

[38] A partir de 1957, sauf pour Curaçao, il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre des morts fœtales tardives mais non celui des naissances vivantes qui sert au calcul des rapports. A partir de 1952, rapports calculés sur la base des naissances qui comprennent celles qui sont survenues parmi les résidents hors du pays s'ils sont inscrits sur un registre de population des Antilles néerlandaises.

[39] Ensemble des morts fœtales quelle que soit la durée de gestation, bien que l'enregistrement ne soit obligatoire que pour les morts fœtales survenant après 28 semaines ou plus de gestation.

[40] Non compris la Zone du Canal qui fait l'objet d'une rubrique distincte (voir plus haut), ni les Indiens vivant en tribus au nombre de 48 654 en 1950 et *60 540 en 1960.

[41] Morts fœtales survenues après 5 mois de gestation au moins. Les rapports pour les morts fœtales de 28 semaines au moins de gestation sont les suivants: 1947-49, *10,5, 1950-51, *13,1, 1958-59, 22,6 et 1960, 24,1.

[42] Pour 1959, non compris Hawaii.

[43] Pour les années antérieures à 1954, données classées selon l'année de l'enregistrement et non l'année de l'événement.

8. Late foetal deaths and late foetal death ratios (continued)

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[3] Live-born infants dying before registration of birth are included among late foetal deaths but are excluded from live births used in the computation of ratios.
[4] Three-year average.
[6] Two-year average.
[8] Not computed by the Statistical Office of the United Nations.
[9] Four-year average.
[10] For 1950.
[13] For 1955.
[43] Prior to 1954, data tabulated by year of registration rather than occurrence.
[44] Prior to 21 April 1960, known as Rio de Janeiro (Federal District).
[45] Excluding Amerindians, shown separately below.
[46] Ratios computed on live births which have been adjusted for underregistration; for details, see Table 6.
[47] Foetal deaths are number of burial permits; ratios computed on number of baptisms recorded in Roman Catholic church registers.
[48] Data are all foetal deaths irrespective of gestational age, although compulsory registration is required only for deaths of foetuses of 6 or more months' gestation.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données classées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[3] Il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre des morts fœtales tardives, mais non celui des naissances vivantes qui sert au calcul des rapports.
[4] Moyenne pour 3 ans.
[6] Moyenne pour 2 ans.
[8] Le calcul n'a pas été fait par le Bureau de statistique de l'ONU.
[9] Moyenne pour 4 ans.
[10] 1950.
[13] 1955.
[43] Pour les années antérieures à 1954, données classées selon l'année de l'enregistrement et non l'année de l'événement.
[44] Antérieurement au 21 avril 1960, connue sous le nom de Rio de Janeiro (district fédéral).
[45] Non compris les Amérindiens qui font l'objet d'une rubrique distincte ci-dessous.
[46] Rapports calculés sur la base du nombre des naissances vivantes, ajusté pour tenir compte des lacunes de l'enregistrement; pour plus de détails, voir le tableau 6.
[47] Les données représentent le nombre des permis d'inhumer. Rapports calculés sur la base du nombre des baptêmes inscrits sur les registres de l'Eglise catholique romaine.
[48] Ensemble des morts fœtales quelque soit la durée de gestation bien que l'enregistrement ne soit obligatoire que pour les morts fœtales de 6 mois ou plus de gestation.

8. Morts fœtales tardives et rapports de mortinatalité (suite)

[Voir note au début du tableau.]

[49] Excluding Indian jungle population. Prior to 1955, excluding Galápagos Islands, and prior to 1954, also Provinces of Napo Pastaza, Morona Santiago and Zamora Chinchipe.
[50] Data are deaths of foetuses of 6 or more months' gestation. Ratios for deaths of foetuses of 28 or more weeks' gestation are as follows: 1952-53, 52.6 and 1957-59, 49.7.
[51] Excluding Indian jungle population, estimated at 350 000 in 1940. Statistics based on burial permits.
[52] Registration, as measured by burial permits, estimated to be 50 per cent complete.
[53] Excluding Indian and Negro population living in tribes, estimated at 22 000 in 1945 and 26 000 in 1946-1957.
[54] For all foetal deaths irrespective of gestational age. Average ratio for deaths of foetuses of 28 or more weeks' gestation for 1952-55 is 23.3.
[55] Excluding Indian jungle population, numbering 56 705 in 1950 and estimated at 31 800 in 1961.
[56] Excluding dependencies.
[57] Data are for a changing number of towns having a present population of approximately 2 million.
[58] Data are for selected ("Proclaimed") urban areas in which the registrar is a medical practitioner.
[59] Beginning 1955, data are estimates based on experience of 1952-1954.
[60] Data are for a changing group of states and territories which, in 1959, included a population of about 382 million.
[61] For 1949.
[62] Prior to 1958, data are for Jewish population only.
[63] Registration believed to be complete for Jewish population only.
[64] Data are for Japanese nationals in Japan only. Prior to May 1952, excluding Tokara Archipelago and prior to 1954, Amami Islands, both acquired from the Ryukyu Islands on 5 December 1951 and 25 December 1953, respectively. Prior to 1950, data are for deaths of foetuses of three or more months' gestation.
[65] Data are those foetal deaths recorded by Health Service only.
[66] For 1955 for deaths of foetuses of 30 or more weeks' gestation.

[49] Non compris les Indiens de la jungle. Pour les années antérieures à 1955, non compris les îles Galápagos, et, pour les années antérieures à 1954, non compris les provinces Napo Pastaza, Morona Santiago et Zamora Chinchipe.
[50] Morts fœtales survenues après 6 mois de gestation au moins. Les rapports pour les morts fœtales survenues après 28 semaines ou plus de gestation sont les suivants: 1952-53, 52,6 et 1957-59, 49,7.
[51] Non compris les Indiens de la jungle (350 000 en 1940 estimation). Statistiques fondées sur les permis d'inhumer.
[52] La complétude de l'enregistrement, à en juger d'après le nombre des permis d'inhumer est estimée à 22 000 en 1945 et 26 000 en 1946-1957.
[53] Non compris les Indiens et les noirs vivant en tribus (estimés à 22 000 en 1945 et 26 000 en 1946-1957).
[54] Ensemble de morts fœtales quelque soit la durée de gestation. Le taux moyen pour les morts fœtales de 28 semaines ou plus de gestation pour 1952-55 est de 23,3.
[55] Non compris les Indiens de la jungle, au nombre de 56 705 en 1950 et estimés à 31 800 en 1961.
[56] Non compris les dépendances.
[57] Les données se rapportent à un nombre variable de villes ayant une population présente de 2 millions.
[58] Les données se rapportent à certaines zones urbaines à régime spécial ("Proclaimed") où l'officier d'état civil est un médecin.
[59] A partir de 1955, les données sont les estimations basées sur l'expérience 1952-1954.
[60] Données se rapportant à un groupe variable d'Etats et de territoires qui en 1959 comptaient quelque 382 millions d'habitants.
[61] 1949.
[62] Pour les années antérieures à 1958, population juive seulement.
[63] L'enregistrement n'est probablement complet que pour la population juive seulement.
[64] Ne concerne que les nationaux japonais se trouvant au Japon. Pour la période antérieure à mai 1952, non compris l'archipel des Tokara et pour les années antérieures à 1954, non compris les îles Amami, détachés des îles Ryû-kyû et rattachés au Japon les 5 décembre et 25 décembre 1953, respectivement.
[65] Les données ne concernent que les morts fœtales enregistrées par le Service de la Santé.
[66] 1955: morts fœtales survenues après 30 semaines ou plus de gestation.

8. Late foetal deaths and late foetal death ratios (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[3] Live-born infants dying before registration of birth are included among late foetal deaths but are excluded from live births used in the computation of ratios.
[4] Three-year average.
[6] Two-year average.
[9] Four-year average.
[17] Data are deaths of foetuses of 6 or more months' gestation.
[27] Prior to 1956, data tabulated by year of registration rather than occurrence.
[32] Prior to 1951, data tabulated by year of registration rather than occurrence.
[46] Ratios computed on live births which have been adjusted for underregistration; for details, see Table 6.
[61] For 1949.
[67] Data are for a changing registration area which in 1951 comprised about 90 per cent of total population.
[68] Data are incomplete returns; in 1951-1953, reports were received from only 66 per cent of local civil registrars and for 1957-1959, from 81, 84 and 84 per cent, respectively.
[68a] Beginning July 1954, excluding data for *concelho* de Nagar-Aveli (population 41 532 in 1950.)
[69] Registration believed to be complete for "civilized" population only, which represents a relatively small proportion of the total.
[70] Beginning 1953, rates computed on live births tabulated by date of occurrence.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données classées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[3] Il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre des morts fœtales tardives, mais non celui des naissances vivantes qui sert au calcul des rapports.
[4] Moyenne pour 3 ans.
[6] Moyenne pour 2 ans.
[9] Moyenne pour 4 ans.
[17] Morts fœtales survenues après 6 mois de gestation au moins.
[27] Pour les années antérieures à 1956, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[32] Pour les années antérieures à 1951, données calculées selon l'année de l'enregistrement et non l'année de l'événement.
[46] Rapports calculés sur la base du nombre des naissances vivantes ajusté pour tenir compte des lacunes de l'enregistrement; pour plus de détails, voir le tableau 6.
[61] 1949.
[67] Données se rapportant à une zone d'enregistrement variable comprenant environ 90 pour cent de la population totale.
[68] Données incomplètes. En 1951-1953, des bulletins n'ont été reçus que de 66 pour 100 des bureaux d'état civil et en 1957-1959 de 81, 84 et 84 pour 100 de ces bureaux respectivement.
[68a] A partir de juillet 1954, non compris le *concelho* de Nagar-Aveli (population 41 532 en 1950).
[69] L'enregistrement ne serait complet que pour la population "civilisée" qui représente une fraction relativement faible de la population totale.
[70] A partir de 1953, données calculées sur la base des naissances vivantes classées selon l'année de l'événement.

8. Morts fœtales tardives et rapports de mortinatalité (suite)

[Voir note au début du tableau.]

[71] Beginning March 1957, data are for provincial capitals and district centers.
[72] For March to December only.
[73] Data are for changing territory representing 59 per cent of total population in 1955.
[74] For Guernsey and dependencies only.
[75] Excluding Faeroe Islands and Greenland, shown separately.
[76] For 1945-1948, excludes data for civilian aliens living in Denmark without residence permits, numbering about 200 000 in 1945 and about 2 500 at end of 1948.
[77] Prior to 1951, data are for Finnish nationals in Finland only. Prior to 1955 and for 1960, data include deaths of foetuses of less than 28 weeks' gestation.
[78] For 1945, excludes Departments of Bas-Rhin, Haut-Rhin and Moselle.
[79] Includes data for East Berlin.
[80] Including residents of Federal Republic of Germany temporarily in West Berlin and excluding alien armed forces and non-resident civilians temporarily in the area.
[81] Including residents of West Berlin temporarily in the Federal Republic of Germany and excluding alien armed forces and non-resident civilians temporarily in the area.
[82] Including residents outside country if listed in a Netherlands population register. Prior to 1959, excluding events among Amboynese living in camps.

[71] A partir de mars 1957, les données se rapportent aux capitales de provinces et aux chefs-lieux de districts.
[72] De mars à décembre seulement.
[73] Données se rapportant à un territoire variable représentant 59 pour 100 de la population totale en 1955.
[74] Guernesey et dépendances seulement.
[75] Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.
[76] 1945-1948: non compris les civils étrangers habitant le Danemark sans permis de résidence, au nombre de 200 000 environ en 1945 et de 2 500 environ à la fin de 1948.
[77] Pour les années antérieures à 1951, les données ne concernent que les nationaux finlandais se trouvant en Finlande. Avant 1955 et pour 1960 les données comprennent les morts fœtales survenues après moins de 28 semaines de gestation.
[78] 1945: non compris les départements du Bas-Rhin, du Haut-Rhin et de la Moselle.
[79] Y compris Berlin-Est.
[80] Y compris les résidents de la République fédérale d'Allemagne se trouvant temporairement à Berlin-Ouest mais non compris les militaires étrangers et les civils non résidents se trouvant temporairement dans la République Fédérale d'Allemagne.
[81] Y compris les résidents de Berlin-Ouest temporairement dans la République fédérale d'Allemagne mais non compris les militaires étrangers et les civils non résidents se trouvant temporairement à Berlin-Ouest.
[82] Y compris les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais. Pour les années antérieures à 1959, non compris les Amboinais vivant dans des camps.

[83] Prior to 1955, data are all foetal deaths irrespective of gestational age.
[84] Excluding full-blooded aborigines, estimated at 39 319 in June 1954.
[85] Data are for years ended 31 March.
[86] For European population only.
[87] For 1958.
[88] Excluding events among United States military personnel, their dependants and contract employees.
[89] Excludes data for Rota and the outer islands of the Yap district.

[83] Pour les années antérieures à 1955, les données concernent toutes les morts fœtales quelque soit la durée de gestation.
[84] Non compris les aborigènes purs au nombre de 39 319 en juin 1954 (estimation).
[85] Les données se rapportent à des périodes annuelles se terminant le 31 mars.
[86] Population européenne seulement.
[87] 1958.
[88] Non compris les décès survenus dans les familles des militaires des Etats-Unis et des agents contractuels des Etats-Unis.
[89] Non compris Rota ni les îles périphériques du district de Yap.

9. Late foetal deaths by sex and illegitimacy percentages — Mortinatalité tardive selon le sexe et pourcentages des mortinaissances illégitimes : 1952–1960

["Late foetal deaths" are those of at least 28 weeks' gestation. Percentages are the number of illegitimate late foetal deaths per 100 total late foetal deaths. Late foetal deaths of unknown legitimacy are considered illegitimate. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 28. — La "mortinatalité tardive" s'entend des décès de fœtus survenant après 28 semaines de gestation au moins. Les pourcentages représentent le nombre de mortinaissances tardives illégitimes pour 100 mortinaissances. Les mortinaissances tardives dont la légitimité n'est pas établie sont considérées comme des mortinaissances illégitimes. Les données discutables (incomplètes) ou dont le degré d'exactitude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et l'insuffisance des données, voir Notes techniques, page 79.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Including unknown sex.
[2] Including cases of unknown legitimacy.
[9] Former British dependency; declared independent 27 April 1961.
[10] Data are for Freetown only.
[11] Prior to 31 May 1961, known as Union of South Africa.
[12] Between 21 February 1958 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only. Data are for the former Egyptian Region.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les personnes de sexe inconnu.
[2] Y compris les morts fœtales tardives dont la légitimité n'est pas établie.
[9] Ancienne dépendance britannique proclamée indépendante le 27 avril 1961.
[10] Freetown.
[11] Antérieurement au 31 mai 1961 connue sous le nom d'Union sud-africaine.
[12] 21 février 1958-29 septembre 1961: Région égyptienne et Région syrienne; à partir du 29 septembre 1961, ancienne Région égyptienne seulement. Données se rapportent à l'ancienne Région égyptienne.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Including unknown sex.
[2] Including cases of unknown legitimacy.
[8] Data are deaths of foetuses of 180 days' (6 calendar months') or more gestation.
[17] Data include live born infants dying before registration of birth; for frequencies, see Table 8.
[18] Confinements resulting in foetal deaths.
[19] Data are deaths of foetuses of 3 or more months' gestation.
[20] Data are for Aruba, Bonaire and Curaçao only. Except for Curaçao since 1957, data include live-born infants dying before registration of birth.
[21] Data are all foetal deaths irrespective of gestational age, although compulsory registration is required only for deaths of foetuses of 28 or more weeks' gestation.
[22] Data are for cities of Panama and Colon only. Prior to 1956, data are deaths of foetuses of 5 or more months' gestation.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les personnes de sexe inconnu.
[2] Y compris les morts fœtales tardives dont la légitimité n'est pas établie.
[8] Morts fœtales survenues après 180 jours (6 mois civils) ou plus de gestation.
[17] Y compris les enfants nés vivants décédés avant l'enregistrement de la naissance; pour leur nombre, voir le tableau 8.
[18] Accouchements de mort-nés.
[19] Morts fœtales survenues après 3 mois ou plus de gestation.
[20] Aruba, Bonaire et Curaçao. A partir de 1957, à l'exception de Curaçao, les données comprennent les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[21] Ensemble de morts fœtales quelle que soit la durée de gestation, bien que l'enregistrement ne soit obligatoire que pour les morts fœtales survenues après 28 semaines ou plus de gestation.
[22] Les données ne se rapportent qu'aux villes de Panama et de Colon. Pour les années antérieures à 1956, les données représentent les morts fœtales survenues après 5 mois ou plus de gestation.

Italics: Data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
[1] Including unknown sex.
[2] Including cases of unknown legitimacy.
[23] Excluding Hawaii and, prior to 1959, Alaska.
[24] Data are foetal deaths of 5 lunar months' (20 weeks') or more gestation. Data on illegitimacy are foetal deaths recorded in states which require reporting of legitimacy status; foetal deaths of unknown legitimacy are excluded.
[25] Summation of frequencies for male and female gives total of 67; reason for discrepancy not ascertained.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les personnes de sexe inconnu.
[2] Y compris les morts fœtales tardives dont la légitimité n'est pas établie.
[23] Non compris Hawaii et, pour les années antérieures à 1959, non compris l'Alaska.
[24] Morts fœtales survenues après 5 mois lunaires (20 semaines) de gestation au moins. Les données sur l'illégitimité représentent le nombre de morts fœtales enregistrées dans les Etats où la déclaration de la légitimité des naissances est obligatoire; elles ne comprennent pas les enfants mort-nés dont la légitimité n'est pas établie.
[25] La somme des données pour le sexe masculin et le sexe féminin est de 67. On ne sait pas comment s'explique cette divergence.

9. Late foetal deaths by sex and illegitimacy percentages (continued) — Mortinatalité tardive selon le sexe et pourcentages des mortinaissances illégitimes (suite)

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Including unknown sex.
[2] Including cases of unknown legitimacy.
[4] Data include live-born infants dying before registration of birth.
[16] Data are all foetal deaths, irrespective of gestational age.
[32] Excluding Indian jungle population, estimated at 350 000 in 1940. Foetal deaths are number of burial permits.
[33] Excluding Indian jungle population, numbering 56 705 in 1950 and estimated at 31 800 in 1960.
[34] Excluding dependencies.
[35] Data are for a changing number of towns having a present population of approximately 2 million.
[36] Data are for selected ("Proclaimed") urban areas in which the registrar is a medical practitioner.
[37] Beginning 1955, data are estimates based on experience of 1952-1954.
[38] Data are for a changing group of states and territories which, in 1952, included a population of about 278 million, and in 1953, about 281 million.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les personnes de sexe inconnu.
[2] Y compris les morts fœtales tardives dont la légitimité n'est pas établie.
[4] Y compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[16] Ensemble de morts fœtales quelle que soit la durée de gestation.
[32] Non compris les Indiens de la jungle au nombre de 350 000 en 1940 (estimation). Statistiques fondées sur les permis d'inhumer.
[33] Non compris les Indiens de la jungle au nombre de 56 705 en 1950 et 31 800 en 1960 (estimation).
[34] Non compris les dépendances.
[35] Les données se rapportent à un nombre variable de villes ayant une population de 2 millions environ d'habitants.
[36] Les données se rapportent à certaines zones urbaines à régime spécial ("proclaimed") où l'officier d'état civil est médecin.
[37] A partir de 1955, les données sont les estimations basées sur l'expérience 1952-1954.
[38] Les données se rapportent à un groupe variable d'Etats et de territoires qui en 1952 comptaient quelque 278 millions d'habitants et en 1953, quelque 281 millions d'habitants.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Including unknown sex.
[2] Including cases of unknown legitimacy.
[39] Data are for Japanese nationals in Japan only. Prior to May 1952, excluding Tokara Archipelago, and prior to 1954, Amami Islands, both acquired from the Ryukyu Islands on 5 December 1951 and 25 December 1953, respectively.
[40] Data are deaths of foetuses of 30 or more weeks' gestation recorded by Health Service only.
[41] Data are incomplete returns; in 1952 and 1953, reports were received from only 66 per cent of local civil registrars and for 1957-1959, from 81, 84 and 84 per cent, respectively.
[42] Data include foetal deaths of less than 28 weeks' gestation, numbering 7 for both sexes.
[43] Excluding late foetal deaths among non-locally domiciled military and civilian services personnel and their dependants, numbering 21 for both sexes.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les personnes de sexe inconnu.
[2] Y compris les morts fœtales tardives dont la légitimité n'est pas établie.
[39] Ne concerne que les nationaux japonais se trouvant au Japon. Pour la période antérieure à mai 1952, non compris l'archipel des Tokara et pour les années antérieures à 1954 non compris les îles Amami, détachés des îles Ryû-kyû et rattachés au Japon le 5 décembre 1951 et le 25 décembre 1953, respectivement.
[40] Les données représentent les morts fœtales de 30 semaines ou plus de gestation enregistrées par le Service de la Santé.
[41] Données incomplètes, en 1952 et 1953, des bulletins n'ont été reçus que de 66 pour 100 des bureaux d'état civil et en 1957-1959 de 81, 84 et 84 pour 100 respectivement.
[42] Y compris les morts fœtales de moins de 28 semaines de gestation au nombre de 7 pour les deux sexes.
[43] Non compris les morts fœtales tardives survenues parmi les militaires et fonctionnaires civils domiciliés en dehors du territoire, ainsi que les personnes à leur charge les accompagnant, soit au total 21 pour les deux sexes.

9. Late foetal deaths by sex and illegitimacy percentages (continued) — Mortinatalité tardive selon le sexe et pourcentages des mortinaissances illégitimes (suite)

Italics: Data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
[1] Including unknown sex.
[2] Including cases of unknown legitimacy.
[44] Beginning March 1957, data are for provincial capitals and district centres.
[45] For March to December only.
[46] Data are for a changing territory representing 59 per cent of total population in 1955.
[47] For 1953-1958, data are for Jersey only.
[48] Excluding Faeroe Islands and Greenland, shown separately.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les personnes de sexe inconnu.
[2] Y compris les morts fœtales tardives dont la légitimité n'est pas établie.
[44] A partir de mars 1957, les données se rapportent aux capitales de provinces et aux chefs-lieux de districts.
[45] De mars à décembre seulement.
[46] Données se rapportant à un territoire variable représentant 59 pour 100 de la population totale en 1955.
[47] 1953-1958: Jersey seulement.
[48] Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
[1] Including unknown sex.
[2] Including cases of unknown legitimacy.
[8] Data are deaths of foetuses of 180 days' (6 calendar months') or more gestation.
[15] Data include deaths of foetuses of less than 28 weeks' gestation; for frequencies, see Table 10.
[49] Data for illegitimate late foetal deaths include live-born infants dying before registration of birth, which for late foetal deaths for 1952-1960 number 3 699, 3 544, 3 546, 3 614, 3 809, 3 878, 3 655, 3 626 and 3 523, respectively, for both sexes.
[50] Including data for East Berlin.
[51] Including residents of Federal Republic of Germany temporarily in West Berlin, and excluding alien armed forces and non-resident civilians temporarily in the area.
[52] Including residents of West Berlin temporarily in the Federal Republic of Germany, and excluding alien armed forces and non-resident civilians temporarily in the area.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
[1] Y compris les personnes de sexe inconnu.
[2] Y compris les morts fœtales tardives dont la légitimité n'est pas établie.
[8] Morts fœtales survenues après 180 jours (6 mois civils) ou plus de gestation.
[15] Y compris les morts fœtales survenues après moins de 28 semaines de gestation; pour leur nombre voir le tableau 8.
[49] Les données représentant les morts fœtales tardives illégitimes comprennent les enfants nés vivants décédés avant l'enregistrement de la naissance. Le total des morts fœtales tardives pour 1952-1960 s'élève à 3 699, 3 544, 3 546, 3 614, 3 809, 3 878, 3 655, 3 626 et 3 523, respectivement, pour les deux sexes.
[50] Y compris Berlin-Est.
[51] Y compris les résidents de la République fédérale d'Allemagne temporairement à Berlin-Ouest mais non compris les militaires étrangers et les civils non résidents se trouvant temporairement dans la République fédérale d'Allemagne.
[52] Y compris les résidents de Berlin-Ouest se trouvant temporairement dans la République fédérale d'Allemagne, mais non compris les militaires étrangers et les civils non résidents se trouvant temporairement à Berlin-Ouest.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Including unknown sex.
[2] Including cases of unknown legitimacy.
[56] Data include death of one foetus of less than 28 weeks' gestation.
[57] Data include deaths of foetuses of less than 28 weeks' gestation, numbering 10 for 1958, 7 for 1959 and 10 for 1960 for both sexes.
[58] Excluding United States military personnel, their dependants and contract employees.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les personnes de sexe inconnu.
[2] Y compris les morts fœtales tardives dont la légitimité n'est pas établie.
[56] Y compris une mort fœtale survenue après moins de 28 semaines de gestation.
[57] Y compris les morts fœtales survenues après moins de 28 semaines de gestation au nombre de 10 en 1958, 7 en 1959 et 10 en 1960 pour les deux sexes.
[58] Non compris les familles des militaires des Etats-Unis, les membres de leur famille les accompagnant et les agents contractuels des Etats-Unis.

10. Foetal deaths and foetal death ratios by gestational age — Morts fœtales et rapports de mortalité fœtale selon la durée de la gestation : 1952–1960

[Ratios are the number of foetal deaths at each gestational age per 1 000 total live births. Gestational age reported in months has been allocated to corresponding intervals in weeks according to conversion scale set forth on page 29. Reliability and comparability of data are known to be greatly affected by incomplete or irregular registration of foetal deaths and/or live births, and by variations in definitions. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 29. — Les rapports représentent le nombre de morts fœtales à chaque période de gestation pour 1 000 naissances vivantes. Les renseignements fournis pour des périodes de gestation exprimées en mois ont été reclassés d'après le nombre de semaines de gestation au moyen de la table de conversion figurant à la page 80. La qualité et la comparabilité des données sont considérablement réduites en raison de l'enregistrement incomplet ou irrégulier des morts fœtales, ou des naissances vivantes, ou de ces deux séries d'événements, et du manque d'uniformité dans les définitions. Les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 80.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Prior to 1959, including the two Departments of the Sahara.
[2] Live-born infants dying before registration of birth are included among foetal deaths but excluded from live births used in computation of ratios.
[3] Data are deaths of foetuses of 180 days' (6 calendar months' or 26 weeks') or more gestation (those for which registration is compulsory).
[4] Excludes deaths of foetuses of less than 180 days' (6 calendar months' or 26 weeks') gestation.
[5] Between 21 February 1958 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only. Data are for the former Egyptian Region.
[6] Excluding Newfoundland. Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.
[7] Data are deaths of foetuses of 28 weeks' or more gestation (those for which registration is compulsory).
[8] Registration of deaths of foetuses of less than 28 weeks' gestation is not compulsory.
[9] Ratios computed on live births tabulated by year of occurrence but registered during the period 1955-1960. For completeness of birth registration, see Table 6.
[10] Live-born infants dying before registration of birth are included among foetal deaths but excluded from live births used in computation of ratios; for numbers of these, see Table 8.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Pour les années antérieures à 1959, y compris les deux départements du Sahara.
[2] Il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre de morts fœtales mais non celui des naissances vivantes qui sert au calcul des rapports.
[3] Morts fœtales survenues après 180 jours de gestation ou plus (au moins 6 mois civils ou 26 semaines) pour lesquelles l'enregistrement est obligatoire.
[4] Non compris les morts fœtales de moins de 180 jours de gestation (au moins 6 mois civils ou 26 semaines).
[5] 21 février 1958-29 septembre 1961: Région égyptienne et Région syrienne; à partir du 29 septembre 1961, ancienne Région égyptienne seulement. Les données se rapportent à l'ancienne Région égyptienne.
[6] Non compris Terre-Neuve. Y compris les résidents canadiens se trouvant temporairement aux Etats-Unis mais non compris les résidents des Etats-Unis se trouvant temporairement au Canada.
[7] Les données représentent les morts fœtales de 28 semaines de gestation ou plus, pour lesquelles l'enregistrement est obligatoire.
[8] L'enregistrement des morts fœtales de moins de 28 semaines de gestation n'est pas obligatoire.
[9] Rapports calculés sur la base des naissances vivantes, enregistrées au cours de la période 1955-1960, classées selon l'année de l'événement. Pour la complétude de l'enregistrement des naissances, voir le tableau 6.
[10] Il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre de morts fœtales mais non celui des naissances vivantes qui sert au calcul des rapports; pour leur nombre, voir le tableau 8.

10. Foetal deaths and foetal death ratios by gestational age (continued) — Morts fœtales et rapports de mortalité fœtale selon la durée de la gestation (suite)

[See note at head of table. — Voir note au début du tableau.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[3] Data are deaths of foetuses of 180 days' (6 calendar months' or 26 weeks') or more gestation (those for which registration is compulsory).
[4] Excludes deaths of foetuses of less than 180 days' (6 calendar months' or 26 weeks') gestation.
[8] Registration of deaths of foetuses of less than 28 weeks' gestation is not compulsory.
[10] Live-born infants dying before registration of birth are included among foetal deaths but excluded from live births used in computation of ratios; for numbers of these, see Table 8.
[11] Data are deaths of foetuses of 3 calendar months' or more gestation.
[12] Excludes deaths of foetuses of less than 3 calendar months' gestation.
[13] Excluding data for Canal Zone, shown separately above; also excluding tribal Indian population, numbering *60 540 in 1960.
[14] Marked increases beginning 1957 are due to improvements in registration of foetal deaths, especially of deaths of foetuses of less than 5 months' gestation in the city of Panama.
[15] Registration of deaths of foetuses of less than 5 lunar months' (20 weeks') gestation is not compulsory.
[16] Data are deaths of foetuses of 5 lunar months' (20 weeks') or more gestation (those for which registration is compulsory).
[17] Compulsory registration requirements vary from state to state and include minima between "any product of conception" to "completed 6 months of gestation". The majority place the minimum at 20 weeks of gestation.
[18] Excluding Hawaii.
[19] Precise specification of compulsory registration requirement not available.
[20] Prior to 21 April 1960, known as Rio de Janeiro (Federal District).

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[3] Morts fœtales survenues après 180 jours de gestation ou plus (au moins 6 mois civils ou 26 semaines) pour lesquelles l'enregistrement est obligatoire.
[4] Non compris les morts fœtales de moins de 180 jours de gestation (au moins 6 mois civils ou 26 semaines).
[8] L'enregistrement des morts fœtales de moins de 28 semaines de gestation n'est pas obligatoire.
[10] Il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre de morts fœtales mais non celui des naissances vivantes qui sert au calcul des rapports; pour leur nombre, voir le tableau 8.
[11] Morts fœtales survenues après 3 mois civils de gestation ou plus.
[12] Non compris les morts fœtales de moins de 3 mois civils de gestation.
[13] Non compris la Zone du Canal qui fait l'objet d'une rubrique distincte (voir plus haut); non compris également les Indiens vivant en tribus au nombre de *60 540 en 1960.
[14] L'augmentation marquée observée depuis 1957 s'explique par l'amélioration de l'enregistrement des morts fœtales, en particulier de celles qui sont survenues après moins de 5 mois de gestation dans la ville de Panama.
[15] L'enregistrement des morts fœtales de moins de 5 mois lunaires (20 semaines) n'est pas obligatoire.
[16] Les données représentent les morts fœtales de 5 mois lunaires (20 semaines) ou plus de gestation pour lesquelles l'enregistrement est obligatoire.
[17] Les cas dans lesquels l'enregistrement est obligatoire varient d'un Etat à l'autre; le critère va de "tout produit de la conception" jusqu'aux décès "survenus au bout de 6 mois". Dans la majorité des Etats, le critère minimal est fixé à 20 semaines de gestation.
[18] Non compris Hawaii.
[19] On ignore les conditions précises dans lesquelles l'enregistrement est obligatoire.
[20] Antérieurement au 21 avril 1960 connu sous le nom de Rio de Janeiro (District fédéral).

10. Foetal deaths and foetal death ratios by gestational age (continued) — Morts fœtales et rapports de mortalité fœtale selon la durée de la gestation (suite)

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[2] Live-born infants dying before registration of birth are included among foetal deaths but excluded from live births used in computation of ratios.
[3] Data are deaths of foetuses of 180 days' (6 calendar months' or 26 weeks') or more gestation (those for which registration is compulsory).
[4] Excludes deaths of foetuses of less than 180 days' (6 calendar months' or 26 weeks') gestation.
[7] Data are deaths of foetuses of 28 weeks' or more gestation (those for which registration is compulsory).
[21] Ratios are computed on live births which have been adjusted for underregistration; for details, see Table 6.
[22] Foetal deaths are number of burial permits; ratios computed on number of baptisms recorded in Roman Catholic church registers.
[23] Includes also deaths of foetuses of 20-22 weeks' gestation.
[24] Excludes deaths of foetuses of less than 23 weeks' gestation.
[25] Data are for Japanese nationals in Japan only. Prior to May 1952, excluding Tokara Archipelago, and prior to 1954, Amami Islands, both acquired from the Ryukyu Islands on 5 December 1951 and 25 December 1953, respectively.
[26] Data are deaths of foetuses of 3 months' (or 12 weeks') or more gestation (those for which registration is compulsory).
[27] Excludes deaths of foetuses of less than 3 months' gestation.
[28] Data are those recorded by Health Service only.
[29] Data are deaths of foetuses of 22 weeks' or more gestation.
[30] Excludes deaths of foetuses of less than 22 weeks' gestation.
[31] Except for 1953, live-born infants dying before registration of birth are included among foetal deaths, as well as among live births used in computation of ratios. For numbers of these for all gestational ages, see Table 9.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[2] Il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre de morts fœtales mais non celui des naissances vivantes qui sert au calcul des rapports.
[3] Morts fœtales survenues après 180 jours de gestation ou plus (au moins 6 mois civils ou 26 semaines) pour lesquelles l'enregistrement est obligatoire.
[4] Non compris les morts fœtales de moins de 180 jours de gestation (au moins 6 mois civils ou 26 semaines).
[7] Les données représentent les morts fœtales de 28 semaines de gestation ou plus, pour lesquelles l'enregistrement est obligatoire.
[21] Rapports calculés sur la base du nombre des naissances vivantes, ajusté pour tenir compte des lacunes de l'enregistrement; pour plus de détails, voir le tableau 6.
[22] Les morts fœtales représentent le nombre des permis d'inhumer; rapports calculés sur la base du nombre de baptêmes inscrits sur les registres de l'Eglise catholique romaine.
[23] Y compris les morts fœtales de 20-22 semaines de gestation.
[24] Non compris les morts fœtales de moins de 23 semaines de gestation.
[25] Ne concerne que les nationaux japonais se trouvant au Japon.
[26] Morts fœtales survenues après 3 mois de gestation (12 semaines), pour lesquelles l'enregistrement est obligatoire.
[27] Non compris les morts fœtales de moins de 3 mois de gestation.
[28] Les données représentent les décès enregistrées par le Service de la Santé seulement.
[29] Les données représentent les morts fœtales de 22 semaines de gestation ou plus.
[30] Non compris les morts fœtales de moins de 22 semaines de gestation.
[31] Sauf pour 1953, les décès d'enfants nés vivants survenus avant l'enregistrement de la naissance sont compris parmi les morts fœtales ainsi que parmi les naissances vivantes servant au calcul des rapports. Pour les chiffres des morts fœtales, indépendamment de la durée de la gestation, voir le tableau 9.

10. Foetal deaths and foetal death ratios by gestational age (continued) — Morts fœtales et rapports de mortalité fœtale selon la durée de la gestation (suite)

[See note at head of table. — Voir note au début du tableau.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
[8] Registration of deaths of foetuses of less than 28 weeks' gestation is not compulsory.
[32] Including residents outside country if listed in a Netherlands population register. Prior to 1959, excluding Amboynese living in camps.
[33] Reason for discrepancy between sum of frequencies for gestational ages 28 weeks and over shown here and total late foetal deaths shown in Table 8 not ascertained.
[34] Excludes deaths of foetuses of 31 weeks' gestation.
[35] For 31-34 weeks' gestation.
[36] Includes also deaths of foetuses of 35-36 weeks' gestation.
[37] Data are deaths of foetuses of 16 weeks' (4 calendar months') or more gestation notified by midwives and physicians.
[38] Excludes deaths of foetuses of less than 16 weeks' gestation.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
[8] L'enregistrement des morts fœtales de moins de 28 semaines de gestation n'est pas obligatoire.
[32] Non compris les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais. Antérieurement à 1959, non compris les Amboinais vivant dans des camps.
[33] On ne sait pas comment s'explique la différence entre la somme des données pour la durée de gestation de 28 semaines ou plus présentée ici et le total des morts fœtales indiqué au tableau 8.
[34] Non compris les morts fœtales survenues après 31 semaines de gestation.
[35] Morts fœtales survenues après 31-34 semaines de gestation.
[36] Y compris les morts fœtales de 35-36 semaines de gestation.
[37] Les données représentent les morts fœtales de 16 semaines ou plus de gestation (4 mois civils) rapportées par les sages-femmes et les médecins.
[38] Non compris les morts fœtales de moins de 16 semaines de gestation.

11. Perinatal deaths and perinatal death ratios : 1952–1960

[Perinatal deaths are the sum of late foetal deaths (those of at least 28 weeks' gestation) and semanatal deaths (deaths under 1 week of age). Deaths of foetuses of unknown gestational age are included among late foetal deaths. Ratios are the number of perinatal deaths per 1 000 live births. Italics indicate that data are unreliable (incomplete). For method of evaluation and limitations of data, see Technical Notes, page 30.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[2] Including the two Departments of the Sahara.
[3] Live-born infants dying before registration of birth are included among late foetal deaths and excluded from live births used in computation of ratios.
[4] Data include also deaths of infants aged 7-9 days.
[5] Population which has fulfilled certain conditions established by law, i.e., achieved a prescribed degree of material and social development as measured by educational level, language used and mode of living.
[6] Data include deaths of foetuses of 6 or more months' gestation.
[7] Prior to 31 May 1961, known as Union of South Africa.
[8] Live-born infants dying within 24 hours of birth are included among late foetal deaths and excluded from live births used in computation of ratios.
[9] Between 21 February 1958 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only. Data are for the former Egyptian Region.
[10] For localities having Health Bureaux, which comprised 43.7 per cent of total population in 1958.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données classées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[2] Y compris les deux départements du Sahara.
[3] Il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre de morts fœtales tardives mais non celui des naissances vivantes qui sert au calcul des rapports.
[4] Les données comprennent également les décès d'enfants âgés de 7-9 jours.
[5] Population remplissant certaines conditions fixées par la loi, c'est-à-dire ayant atteint un certain degré de développement matériel et social déterminé au point de vue du niveau d'instruction, de la langue parlée et du mode de vie.
[6] Y compris les morts fœtales survenues après 6 semaines ou plus de gestation.
[7] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.
[8] Il est tenu compte des enfants nés vivants décédés dans les 24 heures qui ont suivi leur naissance pour établir le nombre des morts fœtales tardives mais non celui des naissances vivantes qui sert au calcul des rapports.
[9] 21 février 1958-29 septembre 1961: Région égyptienne et Région syrienne. A partir du 29 septembre 1961, ancienne Région égyptienne seulement. Les données se rapportent à l'ancienne Région égyptienne.
[10] Données concernant les localités dotées d'un bureau d'hygiène, qui comprenaient 43,7 pour 100 de la population totale en 1958.

11. Morts périnatales et rapports de périnatalité : 1952–1960

[Les morts périnatales comprennent les morts fœtales tardives (survenues après vingt-huit semaines au moins de gestation) et les morts survenues dans la première semaine qui suit la naissance. Les données du présent tableau comprennent les morts fœtales survenues après une gestation de durée inconnue. Les rapports représentent le nombre de morts périnatales pour 1 000 naissances vivantes. Les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et les insuffisances des données, voir Notes Techniques, page 81.]

[11] Excluding tourists and, beginning 1956, United Kingdom and United States armed forces and their dependants stationed in the area.
[12] Prior to 1956, data tabulated by year of registration rather than occurrence.
[13] Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.
[14] Ratios computed on live births tabulated by year of occurrence but registered during the period 1952-1960. For completeness of birth registration, see Table 6.
[15] Includes foetal deaths of less than 28 weeks' gestation.
[16] For 1956-1958, data are for Aruba, Bonaire and Curaçao; for 1959, for Aruba and Curaçao only.
[17] Except for Curaçao since 1957, live born infants dying before registration of birth are included among late foetal deaths but are excluded from live births used in computation of ratios. Ratios computed on live births which include those occurring outside the islands if one or both parents are listed in Netherlands Antilles register.
[18] Excluding data for Canal Zone, shown separately above; also excluding tribal Indian population, numbering *60 540 in 1960.
[19] Includes deaths of foetuses of 5 or more months' gestation.

[11] Non compris les touristes et à partir de 1956, les militaires du Royaume-Uni et des Etats-Unis en garnison sur le territoire et les membres de leur famille les accompagnant.
[12] Pour les années antérieures à 1956, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[13] Y compris les résidents canadiens temporairement aux Etats-Unis mais non compris les résidents des Etats-Unis temporairement au Canada.
[14] Rapports calculés sur la base des naissances vivantes classées selon l'année de l'événement mais enregistrées au cours de la période 1952-1960. Pour la complétude de l'enregistrement, voir le tableau 6.
[15] Y compris les morts fœtales de moins de 28 semaines de gestation.
[16] 1956-1958, les données concernent Aruba, Bonaire et Curaçao; 1959 Aruba et Curaçao seulement.
[17] Sauf pour Curaçao, à partir de 1957, il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre de morts fœtales tardives mais non celui des naissances vivantes qui sert au calcul des rapports. Pour établir le nombre des naissances vivantes qui sert au calcul des rapports, il est tenu compte de celles qui sont survenues hors des îles lorsque les parents ou l'un d'eux sont inscrits sur le registre de population des Antilles néerlandaises.
[18] Non compris la Zone du Canal qui fait l'objet d'une rubrique distincte (voir plus haut); à l'exclusion aussi des Indiens de la jungle au nombre de *60 540 en 1960.
[19] Y compris les morts fœtales de 5 mois ou plus de gestation.

11. Perinatal deaths and perinatal death ratios (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[3] Live-born infants dying before registration of birth are included among late foetal deaths and excluded from live births used in computation of ratios.
[6] Data include deaths of foetuses of 6 or more months' gestation.
[20] Foetal deaths tabulated by year of occurrence, infant deaths and live births tabulated by year of registration.
[20a] Prior to 21 April 1960, known as Rio de Janeiro (Federal District).
[21] Ratios computed on live births which have been adjusted for underregistration; for details, see Table 6.
[22] Perinatal deaths are number of burial permits; ratios computed on number of baptisms recorded in Roman Catholic church registers.
[23] Excluding Indian jungle population.
[24] Excludes data for Galápagos Islands.
[25] Data are for an area covered by 44 Health Units and 76 Health "Posts" which is not representative of Paraguay.
[26] Excluding Indian jungle population, estimated at 350 000 in 1940.
[27] Foetal deaths are number of burial permits.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données classées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[3] Il est tenu compte des enfants nés vivants décédés avant l'enregistrement de leur naissance pour établir le nombre de morts fœtales tardives mais non celui des naissances vivantes qui sert au calcul des rapports.
[6] Y compris les morts fœtales survenues après 6 semaines ou plus de gestation.
[20] Les morts fœtales sont calculées selon l'année de l'événement tandis que les décès d'enfants et les naissances vivantes sont calculées selon l'année de l'enregistrement.
[20a] Antérieurement au 21 avril 1961, connue sous le nom de Rio de Janeiro (District fédéral).
[21] Rapports calculés sur la base du nombre des naissances vivantes, ajusté pour tenir compte des lacunes de l'enregistrement; pour plus de détails, voir le tableau 6.
[22] Les morts périnatales représentent le nombre des permis d'inhumer. Rapports calculés sur la base du nombre de baptêmes inscrits sur les registres de l'Eglise catholique romaine.
[23] Non compris les Indiens de la jungle.
[24] Non compris les îles Galápagos.
[25] Les données se rapportent à une zone desservie par 44 centres sanitaires et 76 postes sanitaires qui n'est pas représentative du Paraguay.
[26] Non compris les Indiens de la jungle au nombre de 350 000 en 1940 (estimation).
[27] Les morts fœtales représentent le nombre de permis d'inhumer.

11. Morts périnatales et rapports de périnatalité (suite)

[Voir note au début du tableau.]

[28] Excluding Indian jungle population, numbering 56 705 in 1950 and estimated at 31 800 in 1961.
[29] Live births and late foetal deaths tabulated by year of occurrence, infant deaths tabulated by year of registration.
[30] Excluding dependencies.
[31] Beginning 1955, data are estimates based on experience of 1952-1954.
[32] Prior to 1958, for Jewish population only.
[33] Registration believed to be complete for Jewish population only.
[34] Data are for Japanese nationals in Japan only. Prior to 1954, excluding Amami Islands, acquired from the Ryukyu Islands on 25 December 1953.
[35] Data are those recorded by Health Service only.
[36] Excludes deaths of foetuses of less than 30 weeks' gestation.
[37] Data are incomplete returns; in 1952, reports were received from only 66 per cent of local civil registrars and for 1957-1959, from 81, 84 and 84 per cent, respectively.
[38] Registration believed to be complete for "civilized" population only, which represents a relatively small proportion of the total.
[39] Beginning 1953, rates computed on live births tabulated by date of occurrence.
[40] Excludes events among non-locally domiciled military and civilian services personnel and their dependants.
[41] For 1952-1956 and 1958, data exclude deaths of infants aged 5 days and over.

[28] Y compris les Indiens de la jungle au nombre de 56 705 en 1950 et estimés à 31 800 en 1961.
[29] Les naissances vivantes et les morts fœtales tardives sont calculées selon l'année de l'événement et les décès d'enfants selon l'année de l'enregistrement.
[30] Non compris les dépendances.
[31] A partir de 1955, les données sont les estimations basées sur les chiffres de 1952-1954.
[32] A partir de 1958, population juive seulement.
[33] L'enregistrement n'est probablement complet que pour la population juive seulement.
[34] Ne concerne que les nationaux japonais se trouvant au Japon. Avant 1954, non compris les îles Amami, détachées des îles Ryû-kyû le 25 décembre 1953.
[35] Les données représentent les morts périnatales enregistrées par le Service de la santé.
[36] Non compris les morts fœtales de moins de 30 semaines de gestation.
[37] Données incomplètes; en 1952 des bulletins n'ont été reçus que de 66 pour cent des bureaux d'état civil, en 1957-1959, de 81, 84 et 84 pour cent, respectivement.
[38] L'enregistrement ne serait complet que pour la population civilisée qui représente une fraction relativement faible de la population totale.
[39] A partir de 1953, taux calculés d'après les naissances vivantes classées selon la date de l'événement.
[40] Non compris les événements survenus parmi les militaires et agents civils domiciliés en dehors du territoire et les membres de leur famille les accompagnant.
[41] 1952-1956 et 1958: non compris les décès d'enfants âgés de 5 jours ou plus.

11. Perinatal deaths and perinatal death ratios (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[4] Data include also deaths of infants aged 7-9 days.
[6] Data include deaths of foetuses of 6 or more months' gestation.
[15] Includes foetal deaths of less than 28 weeks' gestation.
[21] Ratios computed on live births which have been adjusted for underregistration; for details, see Table 6.
[42] Excluding Faeroe Islands and Greenland.
[43] Including nationals temporarily outside country.
[44] Data include also deaths of infants aged 7-10 days.
[45] Including residents of Federal Republic of Germany temporarily in West Berlin and excluding alien armed forces and non-resident civilians temporarily in the area.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données classées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[4] Les données comprennent également les décès d'enfants âgés de 7-9 jours.
[6] Y compris les morts fœtales survenues après 6 semaines ou plus de gestation.
[15] Y compris les morts fœtales de moins de 28 semaines de gestation.
[21] Rapports calculés sur la base du nombre des naissances vivantes, ajusté pour tenir compte des lacunes de l'enregistrement; pour plus de détails, voir le tableau 6.
[42] Non compris les îles Féroé et le Groenland.
[43] Y compris les nationaux temporairement en dehors du pays.
[44] Y compris les décès d'enfants âgés de 7-10 jours.
[45] Y compris les résidents de la République fédérale d'Allemagne se trouvant temporairement à Berlin-Ouest, mais non compris les militaires étrangers et les civils non résidents se trouvant temporairement dans la République fédérale d'Allemagne

11. Morts périnatales et rapports de périnatalité (suite)

[Voir note au début du tableau.]

[46] Including residents of West Berlin temporarily in the Federal Republic of Germany and excluding alien armed forces and non-resident civilians temporarily in the area.
[47] Prior to 1956, deaths under 1 week tabulated by date of registration.
[48] Including residents outside country if listed in a Netherlands population register. Prior to 1959, excluding Amboynese living in camps.
[49] Including deaths of infants under 1 week among Norwegian residents temporarily outside country.
[50] Deaths of infants under 1 week tabulated by date of registration.
[51] Excludes data for Koper and Buje, that part of the former Free Territory of Trieste incorporated in October 1954.
[52] Excluding full-blooded aborigines, estimated at 39 319 in June 1954.
[53] Data are for years ended 31 March.
[54] Excludes data for Maori population.
[55] Excluding United States military personnel, their dependants and contract employees.
[56] Excludes data for Rota and outlying islands of the Yap district.

[46] Y compris les résidents de Berlin-Ouest se trouvant temporairement dans la République fédérale d'Allemagne mais non compris les militaires étrangers et les civils non résidents se trouvant temporairement à Berlin-Ouest.
[47] Pour les années antérieures à 1956, les décès de moins de 1 semaine sont calculés selon la date de l'enregistrement.
[48] Y compris les résidents en dehors du pays s'ils sont inscrits sur un registre de population néerlandais. Pour les années antérieures à 1959, non compris les Amboinais vivant dans des camps.
[49] Y compris les décès d'enfants de moins de 1 semaine survenus parmi les résidents norvégiens temporairement en dehors du pays.
[50] Les décès d'enfants de moins de 1 semaine sont calculés selon la date de l'événement.
[51] Non compris Koper et Buje.
[52] Non compris les aborigènes de race pure, estimés à 39 319 en juin 1954.
[53] Les données se rapportent à des périodes annuelles se terminant le 31 mars.
[54] Non compris la population maorie.
[55] Non compris les militaires des Etats-Unis et les membres de leur famille les accompagnant, ni les agents contractuels des Etats-Unis.
[56] Non compris Rota ni les îles périphériques du district de Yap.

12. Infant deaths, 1952-1961 and infant mortality rates, 1945-59 and 1952-1961.

[Data exclude foetal deaths. Rates are the number of deaths of infants under 1 year of age per 1 000 live births. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 31.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[2] Including the two Departments of the Sahara.
[3] Data exclude live-born infants dying before registration of birth.
[4] Four-year average.
[5] Population which has fulfilled certain conditions established by law, i.e., achieved a prescribed degree of material and social development as measured by educational level, language used and mode of living.
[6] Rates based on infant deaths recorded in civil register but computed on live births recorded in baptismal register, considered to be comparable.
[7] For 1955-60. Estimated rate, based on results of sample surveys.
[8] European, Indian and Coloured (mixed) population, together comprising about one per cent of the total.
[9] For 1955.
[10] For 1945.
[11] For 1959.
[12] Estimated rate for Centre Oubangui, based on results of 1959 demographic sample survey of 167 clusters of villages and one urban centre.
[13] Three-year average. For indigenous population only.
[14] Rate(s) not computed by the Statistical Office of the United Nations.
[15] Three-year average. Unusually high rate attributable to effect of cyclone 22 December 1950.
[16] For 1950-52. Estimated rate, based on results of annual demographic sample surveys.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[2] Y compris les deux départements du Sahara.
[3] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[4] Moyenne pour quatre ans.
[5] Population remplissant certaines conditions fixées par la loi, c'est-à-dire ayant atteint un degré de développement matériel et social déterminé du point de vue du niveau d'instruction, de la langue parlée et du mode de vie.
[6] Taux calculés en rapportant le nombre des décès d'enfants de moins d'un an inscrits sur les registres de l'état civil au nombre de naissances vivantes transcrites sur les registres des baptêmes qui ont probablement une valeur comparable.
[7] 1955-60. Taux estimatif obtenu à partir des résultats d'enquêtes par sondage.
[8] Européens, personnes d'origine indienne et personnes de couleur (métis) représentant ensemble 1 pour 100 environ de la population totale.
[9] 1955.
[10] 1945.
[11] 1959.
[12] Taux estimatif concernant la population du Centre Oubangui; ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage effectuée en 1959 dans 167 grappes de villages et un centre urbain.
[13] Moyenne pour trois ans. Population indigène seulement.
[14] Le calcul de ces taux n'a pas été fait au Bureau de statistique des Nations Unies.
[15] Moyenne pour trois ans. Taux anormalement élevé attribuable aux effets du cyclone du 22 décembre 1950.
[16] 1950-52. Taux estimatif obtenu à partir des résultats d'enquêtes démographiques annuelles par sondage.

12. Décès d'enfants de moins d'un an 1952-1961 et taux de mortalité infantile 1945-59 et 1952-1961

[Les données ne comprennent pas les morts fœtales. Les taux représentent le nombre de décès d'enfants de moins d'un an pour 1 000 naissances vivantes. Les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et les insuffisances des données, voir Notes Techniques, page 82.]

[17] Three-year average.
[18] Prior to 1957, infant deaths include late foetal deaths but rates computed on live births.
[19] Two-year average.
[20] For indigenous population only.
[21] Data are for a compulsory registration area of 36 towns and townships which comprised about 12 per cent of total population and is not representative of Ghana.
[22] For registration area only; registration in rest of country incomplete.
[23] Estimated rate for rural areas, based on results of 1955 demographic sample survey of residents; corresponding rate for urban areas is 190.
[24] For 1954.
[25] Estimated rate for indigenous rural population, based on results of 1957-58 demographic sample survey of 69 villages.
[26] For 1957.
[27] Estimated rate for Vallée du Niger (population estimated at 200 000), based on results of 1957-1958 demographic sample survey of 79 rural villages and 3 urban centers.
[28] Estimated rate based on incomplete provisional results of June 1960-May 1961 demographic sample survey.
[29] Northern part of former Spanish Protectorate.
[30] Data exclude live-born infants dying within 24 hours of birth.
[31] Marked increase beginning 1954 due to extension of civil registration system for Moslem population, introduced 1 July 1954.
[32] The former French Protectorate.
[32a] Three-year average. Not computed by the Statistical Office of the United Nations.

[17] Moyenne pour trois ans.
[18] Pour les années antérieures à 1957, les nombres absolus comprennent les mort-nés, mais les taux sont calculés sur la base des naissances vivantes.
[19] Moyenne pour deux ans.
[20] Population indigène seulement.
[21] Données se rapportant à une zone où l'enregistrement est obligatoire; cette zone se compose de 36 villes et municipalités comptant 12 pour 100 environ de la population totale et n'est pas représentative de l'ensemble du Ghana.
[22] Zone d'enregistrement seulement; enregistrement incomplet dans le reste du pays.
[23] Taux estimatif concernant la population des zones rurales; ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage de 1955 sur les résidents; pour les zones urbaines, le taux correspondant est de 190.
[24] 1954.
[25] Taux estimatif concernant la population indigène rurale; ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage effectuée en 1957-58 dans 69 villages.
[26] 1957.
[27] Taux estimatif concernant la population de la vallée du Niger (estimée à 200 000 habitants); ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage effectuée en 1957-1958 dans 79 villages ruraux et 3 centres urbains.
[28] Taux estimatif obtenu à partir des résultats provisoires incomplets de l'enquête démographique par sondage de juin 1960-mai 1961.
[29] Partie nord de l'ancien Protectorat espagnol.
[30] Non compris les enfants nés vivants décédés dans les 24 heures qui ont suivi la naissance.
[31] Les augmentations sensibles observées depuis 1954 s'expliquent par l'extension, le 1er juillet 1954, d'un système d'enregistrement de faits d'état civil pour la population musulmane.
[32] Ancien Protectorat français.
[32a] Moyenne pour trois ans. Le calcul de ce taux n'a pas été fait au Bureau de statistique des Nations Unies.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[4] Four-year average.
[9] For 1955.
[10] For 1945.
[15] Three-year average. Unusually high rate attributable to effect of cyclone 22 December 1950.
[17] Three-year average.
[19] Two-year average.
[24] For 1954.
[26] For 1957.
[30] Data exclude live-born infants dying within 24 hours of birth.
[33] For 1950. Estimated rate, based on results of 1950 demographic sample survey.
[34] For 1948. Estimated rate for African population, based on results of demographic sample survey.
[35] Estimated rate for African population in villages, based on results of 1953-1955 demographic sample survey.
[36] Estimated rate for Basse Vallée (population estimated at 250 000), based on results of 1957-1958 demographic sample survey of 77 rural villages and 5 urban centres.
[37] Estimated rate of 150-200, basis and year unknown.
[38] Former British dependency; declared independent 27 April 1961.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[4] Moyenne pour quatre ans.
[9] 1955.
[10] 1945.
[15] Moyenne pour trois ans. Taux anormalement élevé attribuable aux effets du cyclone du 22 décembre 1950.
[17] Moyenne pour trois ans.
[19] Moyenne pour deux ans.
[24] 1954.
[26] 1957.
[30] Non compris les enfants nés vivants décédés dans les 24 heures qui ont suivi la naissance.
[33] Taux estimatif obtenu à partir des résultats de l'enquête démographique par sondage de 1950.
[34] 1948. Taux estimatif concernant la population africaine; ce taux a été obtenu à partir des résultats d'une enquête démographique par sondage.
[35] Taux estimatif concernant la population africaine des villages; ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage de 1953-1955.
[36] Taux estimatif concernant la population de la Basse Vallée (estimée à 250 000 habitants); ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage effectuée en 1957-1958 dans 77 villages ruraux et 5 centres urbains.
[37] Taux estimatif de 150-200; base et année inconnues.
[38] Ancienne dépendance britannique; proclamée indépendante le 27 avril 1961.

12. Décès d'enfants de moins d'un an et taux de mortalité infantile (suite)

[Voir note au début du tableau.]

[39] For Freetown only.
[40] For 1949.
[41] Prior to 31 May 1961, known as Union of South Africa.
[42] Estimate, based on results of 1955-1956 sample census of population.
[43] For 1947. Estimated rate, based on results of 1948 sample census of population.
[44] Estimated rate for pays Kabré (population estimated at 150 000), based on results of 1957 demographic sample survey of 527 hamlets.
[45] Excluding Algerian refugees temporarily in the country, estimated at 180 000 in 1959.
[46] For 1947. Estimated rate, based on results of 1948 sample census of population; corresponding recorded rate is 97.5.
[47] For 1950.
[48] Between 21 February 1958 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only. The former Syrian Region, which seceded on that date, appears as "Syria" under Asia. Data shown here are for the former Egyptian region.
[49] Infant death registration estimated to be 70 per cent complete.
[50] For localities having Health Bureaux, which comprised 43.7 per cent of total population in 1958.
[51] Estimated rate for Afro-Arab population in Zanzibar, based on results of 1958 population census; corresponding rate for Pemba is 171. Corresponding recorded rate for Zanzibar and Pemba is 29.6.

[39] Freetown seulement.
[40] 1949.
[41] Antérieurement au 31 mai 1961 connue sous le nom d'Union sud-africaine.
[42] Estimation établie à partir des résultats du recensement par sondage de la population effectué en 1955-1956.
[43] 1947. Taux estimatif obtenu à partir des résultats du recensement par sondage de la population effectué en 1948.
[44] Taux estimatif concernant la population du Pays Kabré (estimée à 150 000 habitants); ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage effectuée en 1957 dans 527 hameaux.
[45] Non compris les réfugiés algériens temporairement dans le pays, au nombre de 180 000 environ en 1959 (estimation).
[46] 1947. Taux estimatif obtenu à partir des résultats du recensement par sondage de 1948 sur la population; le taux correspondant calculé d'après les données de l'enregistrement est de 97,5.
[47] 1950.
[48] 21 février 1958 - 29 septembre 1961 : Région égyptienne et Région syrienne. A partir du 29 septembre 1961, ancienne Région égyptienne seulement, l'ancienne Région syrienne ayant fait sécession à cette date, les données pertinentes figurent en regard de la rubrique "Syrie", sous la rubrique générale "Asie". Données se rapportant à l'ancienne Région égyptienne.
[49] L'enregistrement saisirait environ 70 pour cent des décès d'enfants de moins d'un an.
[50] Données concernant les localités dotées d'un bureau d'hygiène qui comprenaient 43,7 pour 100 de la population totale en 1958.
[51] Taux estimatif concernant la population africano-arabe de Zanzibar; ce taux a été obtenu à partir des résultats du recensement de population de 1958; pour Pemba, le taux correspondant est de 171. Le taux correspondant calculé d'après les données de l'enregistrement pour Zanzibar et Pemba est de 29,6.

12. Infant deaths and infant mortality rates (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[3] Data exclude live-born infants dying before registration of birth.
[4] Four-year average.
[17] Three-year average.
[19] Two-year average.
[52] Excluding tourists and United Kingdom and United States armed forces and their dependants stationed in the area.
[53] Prior to 1956, data tabulated by year of registration rather than occurrence.
[54] Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.
[55] For 1945, rates computed on live births tabulated by year of registration; beginning 1946, on live births registered during the period 1946-1960, tabulated by year of occurrence. For completeness of birth registration, see Table 6.
[56] Prior to 1952, rates computed on live births tabulated by year of occurrence.
[57] Prior to 1951, data tabulated by year of registration rather than occurrence.
[58] For 1950 and 1951, data are for indigenous population only and include late foetal deaths.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[3] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[4] Moyenne pour quatre ans.
[17] Moyenne pour trois ans.
[19] Moyenne pour deux ans.
[52] Non compris les décès survenus parmi les touristes ni parmi les militaires du Royaume-Uni et des Etats-Unis en garnison sur le territoire, et les membres de leur famille les accompagnant.
[53] Pour les années antérieures à 1956, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[54] Y compris les décès de résidents canadiens se trouvant temporairement aux Etats-Unis mais non compris les décès de résidents des Etats-Unis se trouvant temporairement au Canada.
[55] 1945 : Taux calculés sur la base des naissances vivantes classées selon l'année de l'enregistrement; à partir de 1946, sur la base des naissances vivantes enregistrées de 1946 à 1960, mais classées selon l'année de l'événement. Pour tous renseignements sur la complétude de l'enregistrement des naissances, voir le tableau 6.
[56] Pour les années antérieures à 1962, taux calculés sur la base des naissances vivantes classées selon l'année de l'événement.
[57] Pour les années antérieures à 1951, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[58] 1950 et 1951 : population indigène seulement, y compris les morts fœtales tardives.

12. Décès d'enfants de moins d'un an et taux de mortalité infantile (suite)

[Voir note au début du tableau.]

[59] Inclusion of deaths of infants dying before registration of birth (which are registered as "stillbirths" although they are known to have breathed) produces rates for 1951-1957 and 1959 of 68.3, 75.6, 60.0, 59.6, 64.8, 51.6, 55.7 and 51.3, respectively. Inclusion of an additional number of "stillbirths" whose ability to breathe was not reported would increase rates for the same period to 90.8, 84.3, 80.4, 79.8, 83.3, 67.0, 62.1 and 58.4, respectively.

[60] Infant death registration estimated to be 50-60 per cent complete and birth registration 85-90 per cent complete in 1956.

[61] Inclusion of deaths of infants dying before registration of birth (which are registered as "stillbirths" although they are known to have breathed) produces rates for 1951-1959 of 73.9, 66.5, 58.2, 53.9, 60.4, 55.1, 53.5, 60.5 and 50.2, respectively. Inclusion of an additional number of "stillbirths" whose ability to breathe was not reported would increase rates for the same period to 92.6, 79.2, 66.5, 64.2, 70.3, 63.3, 67.1, 71.8 and 59.0, respectively.

[62] Except for Curaçao since 1957, data exclude live-born infants dying before registration of birth. Beginning 1952, rates computed on live births which include those among residents outside the country if listed in Netherlands Antilles register. For 1952, 1953 and 1960, data are for Aruba, Bonaire and Curaçao only.

[63] Note suppressed.

[64] Excluding data for Canal Zone, shown separately above. Prior to 1952 excluding tribal Indian population (numbering 48 654 in 1950 and *60 540 in 1960); beginning 1952, including tribal Indian population in Provinces of Bocas del Toro and Darién, where they constitute a relatively high proportion of the population (40.8 and 28.5 per cent, respectively).

[65] For 1955-1957, 1959 and 1960, excluding data for Turks and Caicos Islands. For 1960, also excluding data for Cayman Islands.

[66] For 1945, excludes data for Cayman Islands.

[67] Prior to 1954, data tabulated by year of registration rather than occurrence.

[68] For 1958.

[59] Compte tenu des décès d'enfants survenus avant l'enregistrement de la naissance (ces enfants sont classés parmi les "mort-nés" bien que l'on sache qu'ils ont respiré), les taux pour les années 1951-1957 et 1959 s'établissent comme suit : 68,3; 75,6; 60,0; 59,6; 64,8; 51,6; 55,7 et 51.3 respectivement. Compte tenu du nombre supplémentaire des "mort-nés" dont on ignore s'ils ont pu respirer, les taux correspondants s'établissent comme suit : 90,8; 84,3; 80,4; 79,8; 83,3; 67,0; 62,1 et 58,4 respectivement.

[60] L'enregistrement saisirait 50 à 60 pour cent des décès d'enfants de moins d'un an et 85 à 90 pour cent des naissances en 1956.

[61] Compte tenu des décès d'enfants survenus avant l'enregistrement de la naissance (ces enfants sont classés parmi les "mort-nés" bien que l'on sache qu'ils ont respiré), les taux pour les années 1951-1959 s'établissent comme suit : 73,9; 66,5; 58,2; 53,9; 60,4; 51,1; 53,5; 60,5 et 50,2 respectivement. Compte tenu du nombre supplémentaire des "mort-nés" dont on ignore s'ils ont pu respirer, les taux correspondants s'établissent comme suit : 92,6; 79,2; 66,5; 64,2; 70,3; 63,3; 67,1; 71,8 et 59,0 respectivement.

[62] Depuis 1957, non compris, sauf pour Curaçao, les enfants nés vivants décédés avant l'enregistrement de la naissance. A partir de 1952, taux calculés sur la base des naissances vivantes survenues parmi les résidents se trouvant hors du pays, s'ils sont inscrits sur un registre de population des Antilles néerlandaises. 1952, 1953 et 1960 : Aruba, Bonaire et Curaçao seulement.

[63] Note supprimée.

[64] Non comprise la zone du Canal qui fait l'objet d'une rubrique distincte (voir plus haut). Pour les années antérieures à 1952, non compris les Indiens vivant en tribus (au nombre de 48 654 en 1950 et de *60 540 en 1960); à partir de 1952, y compris les Indiens vivant en tribus dans les Provinces de Bocas del Toro et de Darién, qui représentent une proportion relativement importante de la population (40,8 et 28,5 pour cent respectivement).

[65] 1955-1957, 1959 et 1960 : non compris les îles Turques et Caïques. Pour 1960 non compris les îles Cayman.

[66] 1945 : non compris les îles Cayman.

[67] Pour les années antérieures à 1954, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[68] 1958.

12. Infant deaths and infant mortality rates (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.

* Provisional.

† Data tabulated by year of registration rather than occurrence.

[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.

[3] Data exclude live-born infants dying before registration of birth.

[4] Four-year average.

[14] Rate(s) not computed by the Statistical Office of the United Nations.

[17] Three-year average. [19] Two-year average.

[40] For 1949.

[68a] Revised provisional.

[69] For 1945-1947, data exclude live-born infants dying within 24 hours of birth.

[69a] Prior to 21 April 1960, known as Rio de Janeiro (Federal District).

[70] Estimated average annual rate for 1940-50 for population born in Brazil, based on demographic analysis of 1940 and 1950 census returns.

[71] Excluding Amerindians, shown separately below.

[72] Rates computed on live births which have been adjusted for underregistration; for details, see Table 6.

[73] Infant deaths are number of burial permits but rates computed on number of baptisms recorded in Catholic church registers.

[74] Excluding Indian jungle population. Prior to 1955, excluding Galápagos Islands and prior to 1954, also Provinces of Napo Pastaza, Morona Santiago and Zamora Chinchipe.

[75] Infant death registration estimated to be approximately 70 per cent complete in 1956. Prior to 1954, data tabulated by year of registration rather than occurrence.

[76] Excluding Indian jungle population, estimated at 350 000 in 1940.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.

[3] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.

[4] Moyenne pour quatre ans.

[14] Le calcul de ces taux n'a pas été fait au Bureau de statistique des Nations Unies.

[17] Moyenne pour trois ans. [19] Moyenne pour deux ans.

[40] 1949.

[68a] Données provisoires revisées.

[69] 1945-1957 : non compris les enfants nés vivants décédés dans les 24 heures qui ont suivi la naissance.

[69a] Antérieurement au 21 avril 1960, connue sous le nom de Rio de Janeiro (District fédéral).

[70] Taux annuel moyen estimatif pour 1940-50, concernant la population née au Brésil; ce taux a été obtenu à partir des résultats d'une analyse démographique des recensements de 1940 et de 1950.

[71] Non compris les Amérindiens qui font l'objet d'une rubrique distincte (voir plus bas).

[72] Taux calculés d'après le nombre des naissances vivantes ajusté pour tenir compte des lacunes de l'enregistrement. Pour plus de détails, voir le tableau 6.

[73] Le nombre des décès d'enfants de moins de 1 an est celui des permis d'inhumer; taux calculés d'après le nombre des baptêmes inscrits sur les registres des églises catholiques.

[74] Il n'est pas tenu compte des Indiens de la jungle. Non compris les décès survenus dans les îles Galapagos, pour les années antérieures à 1955, ni dans les Provinces de Napo Pastaza, Morona Santiago et Zamora Chinchipe, pour les années antérieures à 1954.

[75] 1956 : L'enregistrement saisirait environ 70 pour 100 des décès d'enfants de moins de 1 an. Pour les années antérieures à 1954, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[76] Non compris les Indiens de la jungle, au nombre de 350 000 en 1940 (estimation).

12. Décès d'enfants de moins d'un an et taux de mortalité infantile (suite)

[Voir note au début du tableau.]

[77] Excluding Indian and Negro population living in tribes, estimated at 22 000 in 1945 and 26 000 in 1946-1957.

[77a] Beginning 1955, rates are computed on births which include delayed registrations.

[78] Excluding Indian jungle population, numbering 56 705 in 1950 and estimated at 31 800 in 1961.

[79] Beginning 1957, infant deaths tabulated by year of occurrence but rates computed on live births tabulated by year of registration.

[80] Excluding dependencies.

[81] Data are for a changing number of towns having a present population of approximately 2 million.

[82] Estimate, based on results of 1958-1959 demographic sample survey in 345 villages. Rate given for 1955-59 is for 1959 only.

[83] Beginning 1949, excluding foreigners.

[84] Beginning 1955, data are estimates based on experience of 1952-1954.

[85] Estimated average annual rate for 1941-51, based on demographic analysis of 1941 and 1951 census returns.

[85a] Estimated rate for rural India for 1958-1959, based on 14th round of National Sample Survey.

[86] Data are for a changing group of states and territories which in 1959 included a population of about 382 million.

[87] Data are for a changing number of regencies in Java which in 1959 included a population of about 54 million.

[88] Estimated rate; basis unknown.

[89] Prior to 1957 and for 1961, excluding Bedouin population in the Negev.

[90] Infant death registration among non-Jewish population estimated to be less than 75 per cent complete in 1956.

[91] For Jewish population only.

[92] Data are for Japanese nationals in Japan only. Prior to May 1952, excluding Tokara Archipelago and prior to 1954, Amami Islands, both acquired from the Ryukyu Islands on 5 December 1951 and 25 December 1953, respectively.

[77] Non compris les Noirs et les Indiens vivant en tribus : 22 000 personnes en 1945 et 26 000 en 1946-1957 (estimations).

[77a] A partir de 1955, les taux sont calculés sur la base des naissances et comprennent les enregistrements tardifs.

[78] Non compris les Indiens de la jungle, au nombre de 56 705 en 1950 et estimés à 31 800 en 1961.

[79] A partir de 1957, décès des enfants de moins de 1 an classés selon l'année de l'événement mais taux calculés sur la base des naissances vivantes classées selon l'année de l'enregistrement.

[80] Non compris les dépendances.

[81] Les données se rapportent à un nombre variable de villes qui comptent actuellement 2 millions d'habitants environ.

[82] Estimation établie sur la base des résultats de l'enquête démographique par sondage effectuée en 1958-1959 dans 345 villages. Le taux figurant dans la colonne 1955-59 se rapporte à 1959 seulement.

[83] A partir de 1949, non compris les étrangers.

[84] A partir de 1955, estimation fondée sur les résultats d'une évaluation concernant les données pour 1952-1954.

[85] Taux annuel moyen estimatif pour 1941-51; ce taux a été obtenu à partir des résultats d'une analyse démographique des recensements de 1941 et de 1951.

[85a] 1958-1959 : Taux estimatif se rapportant à la population rurale de l'Inde, calculé à partir des résultats de la 14eme. phase de l'enquête nationale par sondage.

[86] Les données se rapportent à un groupe variable d'Etats et de territoires qui, en 1959, comptaient 382 millions d'habitants environ.

[87] Les données se rapportent à un groupe variable de régences de Java qui, en 1959, comptaient 54 millions d'habitants environ.

[88] Taux estimatif; base inconnue.

[89] Pour les années antérieures à 1957 et pour 1961, non compris les Bédouins du Négeb.

[90] 1956, l'enregistrement saisirait : moins de 75 pour cent des décès d'enfants de moins de 1 an survenus dans la population non juive.

[91] Population juive seulement.

[92] Ne concerne que les nationaux japonais se trouvant au Japon. Pour la période antérieure à mai 1952, non compris l'archipel des Tokara et, pour les années antérieures à 1954, les îles Amami, détachées des îles Ryû-Kyû et rattachées au Japon le 5 décembre 1951 et le 25 décembre 1953 respectivement.

12. Infant deaths and infant mortality rates (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.

* Provisional.

† Data tabulated by year of registration rather than occurrence.

[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.

[3] Data exclude live-born infants dying before registration of birth.

[4] Four-year average.

[9] For 1955.

[17] Three-year average.

[19] Two-year average.

[24] For 1954.

[40] For 1949.

[47] For 1950.

[93] Excluding foreigners but including registered Palestinian refugees; for number of refugees, see Table 4. Infant deaths include late foetal deaths but rates computed on live births.

[94] Excluding alien armed forces, civilian aliens employed by armed forces and foreign diplomatic personnel.

[95] Excluding non-resident foreigners and registered Palestinian refugees; for number of refugees, see Table 4.

[96] For 1956.

[97] Data are those recorded by Health Service only.

[98] Data are for a changing registration area which in 1951 comprised about 90 per cent of total population.

[98a] Prior to 1951, data tabulated by year of occurrence.

[99] Beginning July 1954, excluding data for *concelho* of Nagar-Aveli (population 41 532 in 1950).

Italique : Données discutables ou dont le degré de complétude n'est pas connu.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.

[3] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.

[4] Moyenne pour quatre ans.

[9] 1955.

[17] Moyenne pour trois ans.

[19] Moyenne pour deux ans.

[24] 1954.

[40] 1949.

[47] 1950.

[93] Non compris les étrangers, mais y compris les réfugiés de Palestine immatriculés; pour leur nombre, voir le tableau 4. Les nombres absolus comprennent les morts fœtales tardives, mais les taux sont calculés sur la base des naissances vivantes.

[94] Non compris les décès d'enfants de moins de 1 an dans les familles des militaires étrangers, des civils étrangers employés par les forces armées et des membres du corps diplomatique étranger.

[95] Non compris les décès d'enfants de moins de 1 an survenus dans les familles des étrangers non résidents et les familles des réfugiés de Palestine immatriculés; pour le nombre de ces réfugiés, voir le tableau 4.

[96] 1956 seulement.

[97] Les données se rapportent uniquement aux décès d'enfants de moins de 1 an enregistrés par le Service de la santé.

[98] Les données se rapportent à une zone d'enregistrement qui varie suivant les années et qui comprenait, en 1951, environ 90 pour 100 de la population totale.

[98a] Antérieurement à 1951, données exploitées selon l'année de l'événement.

[99] A partir de juillet 1954, non compris le *concelho* de Nagar-Aveli (population 41 532 en 1950).

12. Décès d'enfants de moins d'un an et taux de mortalité infantile (suite)

[Voir note au début du tableau.]

[100] Registration believed to be complete for civilized population only, which represents a relatively small proportion of the total.
[101] Excluding Allied military and civilian personnel and their dependants stationed in the area.
[102] Prior to 1955, data are tabulated by year of registration rather than occurrence.
[103] Estimated rate, based on results of a 6.2 per cent sample survey of population of 1 700 villages. Rate given for 1950-54 is for 1954 only.
[104] Beginning 1953, rates computed on live births tabulated by date of occurrence.
[105] Formerly Syrian Region of United Arab Republic (Africa); reverted to status of independent nation 29 September 1961. Excluding nomad population, estimated at 179 722 at end of 1956 and Palestinian refugees, numbering 124 261 on 1 July 1960; for number of refugees excluded each year 1950-1957, see Table 4. Data are events registered within one month of occurrence.
[106] Beginning March 1957, data are for provincial capitals and district centers.
[107] For March to December only.
[108] Data are for changing territory representing 61 per cent of total population in 1954 and 97 per cent in 1957.
[109] Excludes dependencies of Guernsey.
[110] Beginning 1953, data exclude infants born alive after less than 28 weeks' gestation, of less than 1 000 grammes in weight and 35 centimetres in length, who died within 24 hours of birth.
[111] Excluding Faeroe Islands and Greenland, shown separately.
[112] For 1945-1948, excludes data for civilian aliens living in Denmark without residence permits, numbering about 200 000 in 1945 and about 2 500 at the end of 1948.
[113] Prior to 1951, data are for Finnish nationals in Finland only; beginning 1951, including also data for nationals temporarily outside country.

[100] L'enregistrement ne serait complet que pour la population civilisée qui représente une fraction relativement faible de la population totale.
[101] Non compris les militaires et agents civils alliés en poste sur le territoire, ni les membres de leur famille les accompagnant.
[102] Pour les années antérieures à 1955, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[103] Taux estimatif obtenu à partir des résultats d'une enquête par sondage effectuée dans 1 700 villages comprenant 6,2 pour 100 de la population. Le taux figurant dans la colonne 1950-54 se rapporte à 1954 seulement.
[104] A partir de 1953, taux calculés sur la base des naissances vivantes classées selon la date de l'événement.
[105] Ancienne Région syrienne de la République arabe unie (Afrique) redevenue Etat indépendant le 29 septembre 1961. Non compris la population nomade, soit 179 722 personnes à la fin de 1956 (estimation), ni les réfugiés de Palestine, au nombre de 124 261 le 1er juillet 1960; pour le nombre des réfugiés omis chaque année de 1950 à 1957, voir le tableau 4. Les données représentent les décès d'enfants de moins de 1 an enregistrés dans le mois qui suit l'événement.
[106] A partir de Mars 1957, les données se rapportent aux capitales de provinces et chefs-lieux de districts.
[107] Mars-décembre seulement.
[108] Les données se rapportent à des zones variables comptant 61 pour 100 et 97 pour 100 de la population totale en 1954 et 1957 respectivement.
[109] Non compris les dépendances de Guernesey.
[110] A partir de 1953, il n'est pas tenu compte de enfants nés vivants après moins de 28 semaines de gestation, pesant moins de 1 000 grammes, mesurant moins de 35 centimètres et décédés dans les 24 heures qui ont suivi la naissance.
[111] Non compris les îles Féroé et le Groenland qui font l'objet de rubriques distinctes.
[112] 1945-48 : non compris les civils étrangers résidant au Danemark sans permis de séjour, au nombre de 200 000 en 1945 et de 2 500 à la fin de 1948.
[113] Pour les années antérieures à 1951, les données ne concernent que les nationaux finlandais se trouvant en Finlande; à partir de 1951, y compris les nationaux finlandais se trouvant temporairement hors de Finlande.

12. Infant deaths and infant mortality rates (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[4] Four-year average.
[11] For 1959.
[17] Three-year average.
[19] Two-year average.
[40] For 1949.
[53] Prior to 1956, data tabulated by year of registration rather than occurrence.
[57] Prior to 1951, data tabulated by year of registration rather than occurrence.
[72] Rates computed on live births which have been adjusted for under-registration; for details, see Table 6.
[114] For 1945, excludes data for Departments of Bas-Rhin, Haut-Rhin and Moselle.
[115] Note suppressed.
[116] Including residents of Federal Republic of Germany temporarily in West Berlin and excluding alien armed forces and non-resident civilians temporarily in the area.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[4] Moyenne pour quatre ans.
[11] 1959.
[17] Moyenne pour trois ans.
[19] Moyenne pour deux ans.
[40] 1949.
[53] Pour les années antérieures à 1956, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[57] Pour les années antérieures à 1951, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[72] Taux calculés d'après le nombres des naissances vivantes ajusté pour tenir compte des lacunes de l'enregistrement. Pour plus de détails, voir le tableau 6.
[114] 1945 : non compris les départements du Bas-Rhin, du Haut-Rhin et de la Moselle.
[115] Note supprimée.
[116] Y compris les événements survenus parmi les résidents de la République fédérale d'Allemagne se trouvant temporairement dans Berlin-Ouest, mais non compris ceux survenus dans les familles de militaires étrangers et des civils non résidents se trouvant temporairement sur le territoire.

12. Décès d'enfants de moins d'un an et taux de mortalité infantile (suite)

[Voir note au début du tableau.]

[117] For 1946-1947, excludes data for aliens in the former Saar.
[118] Including residents of West Berlin temporarily in the Federal Republic of Germany and excluding alien armed forces and non-resident civilians temporarily in the area.
[119] Data are events registered within one year of occurrence.
[120] Including residents outside country if listed in a Netherlands population register. Prior to 1959, excluding Amboynese living in camps.
[121] Including infant deaths among residents temporarily outside country.
[122] Note suppressed.
[123] Data tabulated by year of occurrence for England and Wales and by year of registration for Northern Ireland and Scotland.
[124] Excluding full-blooded aborigines, estimated at 39 319 in June 1954.
[125] Prior to 1958, data are for years ended 31 March.
[126] Including data for condominium of Canton and Enderbury, not available separately.
[127] For years ended 30 June.

[117] 1946-47 : non compris les événements survenus parmi les étrangers se trouvant sur l'ancien territoire de la Sarre.
[118] Y compris les événements survenus parmi les résidents de Berlin-Ouest se trouvant temporairement dans la République fédérale d'Allemagne, mais non compris ceux survenus dans les familles des militaires étrangers et des civils non résidents se trouvant temporairement dans Berlin-Ouest.
[119] Evénements enregistrés dans l'année qui suit chacun d'eux.
[120] Y compris les événements survenus parmi les résidents hors du territoire, à la condition qu'ils aient été inscrits sur un registre de population néerlandais. Pour les années antérieures à 1959, non compris les événements survenus parmi les Amboinais vivant dans des camps.
[121] Y compris les décès de résidents se trouvant temporairement hors du pays.
[122] Note supprimée.
[123] Les données sont exploitées selon l'année de l'événement pour l'Angleterre et le pays de Galles, et selon l'année de l'enregistrement pour l'Irlande du Nord et l'Ecosse.
[124] Non compris les aborigènes purs, au nombre de 39 319 en juin 1954 (estimation).
[125] Pour les années antérieures à 1958, les données se rapportent à des périodes annuelles se terminant le 31 mars.
[126] Y compris le Condominium de Canton et Enderbury pour lequel il n'existe pas de données distinctes.
[127] Périodes annuelles se terminant le 30 juin.

12. Infant deaths and infant mortality rates (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[4] Four-year average.
[14] Rate(s) not computed by the Statistical Office of the United Nations.
[17] Three-year average.
[40] For 1949.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[4] Moyenne pour quatre ans.
[14] Le calcul de ces taux n'a pas été fait au Bureau de statistique des Nations Unies.
[1] Moyenne pour trois ans.
[40] 1949.

12. Décès d'enfants de moins d'un an et taux de mortalité infantile (suite)

[Voir note au début du tableau.]

[128] Excluding United States military personnel, their dependents and contract employees. For 1952, data are for indigenous population only and relate to year ended 30 June. For 1954, excluding Rota and outlying islands of the Yap district.

[129] For 1953-1959, data are for Tongan population only.

[130] Prior to 1952, data are for Samoan population only. Prior to 1954, data include late foetal deaths among Samoan population.

[128] Non compris les décès survenus dans les familles des militaires des Etats-Unis, des membres de leur famille les accompagnant et des agents contractuels des Etats-Unis. 1952 : population indigène seulement et période annuelle se terminant le 30 juin. 1954 : non compris Rota, ni les îles périphériques du district de Yap.

[129] 1953-1959 : Tongans seulement.

[130] Pour les années antérieures à 1952, Samoans seulement. Pour les années antérieures à 1954, y compris les morts fœtales tardives survenues dans la population samoane.

13. Infant mortality rates by age and sex — Taux de mortalité infantile selon l'âge et le sexe : 1952–1960

[Rates are deaths of infants of specified age for each sex per 1 000 live births of same sex. Data exclude foetal deaths. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 31. — Les taux représentent le nombre de décès d'enfants d'âge et de sexe donnés pour 1 000 naissances vivantes du même sexe. Il n'est pas tenu compte des morts fœtales. Les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et les insuffisances des données, voir Notes Techniques, page 83.]

Italics: data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Including infant deaths of unknown age and sex.
[2] Including infant deaths of unknown age; excluding infant deaths of unknown sex.
[3] Prior to 1959, including the two Departments of the Sahara.
[4] Data exclude live-born infants dying before registration of birth.
[5] For under 5 days.
[6] Note suppressed.
[7] Note suppressed.
[8] For 1-5 calendar months inclusive.
[9] For 5-9 days inclusive.
[10] For 10 days to under 1 calendar month.
[11] For under 4 days.
[12] For 4-15 days inclusive.
[13] For 16 days to under 1 calendar month.
[14] For 1-6 calendar months inclusive.
[15] For 7-11 calendar months inclusive.
[16] For under 1 calendar month.
[17] For 7 days to under 1 calendar month.
[18] For under 2 calendar months.
[19] For 2-5 calendar months inclusive.
[20] Former French Protectorate.
[21] Population which has fufillled certain conditions established by law, i.e., achieved a prescribed degree of material and social development as measured by educational level, language used and mode of living.
[22] For 28 days to 6 calendar months inclusive.
[23] Data are for indigenous population only.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'enfants d'âge et sexe inconnus.
[2] Y compris les décès d'enfants d'âge inconnu et non compris les décès d'enfants de sexe inconnu.
[3] Pour les années antérieures à 1959, y compris les deux départements du Sahara.
[4] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[5] Moins de 5 jours.
[6] Note supprimée.
[7] Note supprimée.
[8] 1-5 mois civils inclusivement.
[9] 5-9 jours.
[10] 10 jours-moins de 1 mois civil.
[11] Moins de 4 jours.
[12] 4-15 jours inclusivement.
[13] 16 jours-moins de 1 mois civil.
[14] 1-6 mois civils inclusivement.
[15] 7-11 mois civils inclusivement.
[16] Moins de 1 mois civil.
[17] 7 jours-moins de 1 mois civil inclusivement.
[18] Moins de 2 mois civils.
[19] 2-5 mois civils inclusivement.
[20] Ancien Protectorat français.
[21] Population remplissant certaines conditions fixées par la loi, c'est-à-dire ayant atteint un degré de développement matériel et social déterminé du point de vue du niveau d'instruction, de la langue parlée et du mode de vie.
[22] 28 jours-6 mois civils inclusivement.
[23] Population indigène seulement.

Italics: data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Including infant deaths of unknown age and sex.
[2] Including infant deaths of unknown age; excluding infant deaths of unknown sex.
[8] For 1-5 calendar months inclusive.
[16] For under 1 calendar month.
[17] For 7 days to under 1 calendar month.
[24] Prior to 31 May 1961, known as Union of South Africa.
[25] Data exclude live-born infants dying within 24 hours of birth.
[26] Rates exclude deaths of live-born infants dying within 24 hours of birth but are computed on live births including them.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'enfants d'âge et sexe inconnus.
[2] Y compris les décès d'enfants d'âge inconnu et non compris les décès d'enfants de sexe inconnu.
[8] 1-5 mois civils inclusivement.
[16] Moins de 1 mois civil.
[17] 7 jours-moins de 1 mois civil inclusivement.
[24] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.
[25] Non compris les enfants nés vivants et décédés dans les 24 heures qui ont suivi leur naissance.
[26] Non compris les enfants nés vivants et décédés dans les 24 heures qui ont suivi leur naissance; toutefois, le taux a été calculé sur la base de toutes les naissances vivantes.

13. Infant mortality rates by age and sex (continued) — Taux de mortalité infantile selon l'âge et le sexe (suite)

[15] 7-11 mois civils inclusivement.
[16] Moins de 1 mois civil.
[17] 7 jours-moins de 1 mois civil inclusivement.
[18] Moins de 2 mois civils.
[27] 1 jour-moins de 1 mois civil.
[28] 1-2 mois civils inclusivement.
[29] 3-11 mois civils inclusivement.
[30] Moins de 9 jours.
[31] 9 jours-moins de 1 mois civil.
[32] Moins de 10 jours.
[33] Note supprimée.
[34] 21 février 1958-29 septembre 1961: Région égyptienne et Région syrienne. A partir du 29 septembre 1961, ancienne Région égyptienne seulement. Les données se rapportent à l'ancienne Région égyptienne.
[35] Données concernant les localités dotées d'un bureau d'hygiène qui comprenaient 43,7 pour 100 de la population totale en 1958.
[36] Non compris les décès survenus parmi les touristes. A partir de 1961, non compris les décès parmi les militaires du Royaume-Uni et des Etats-Unis en garnison sur le territoire et les membres de leur famille les accompagnant.
[37] On ne sait pas comment s'explique la légère divergence entre ce taux et le taux correspondant qui figure dans le tableau 12.
[38] Y compris les décès des résidents canadiens se trouvant temporairement aux Etats-Unis, mais non compris les décès des résidents des Etats-Unis se trouvant temporairement au Canada.

13. Infant mortality rates by age and sex (continued) — Taux de mortalité infantile selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

Continent, country and year Continent, pays et année	Both sexes (age) — Les deux sexes (âge)						Male (age) — Masculin (âge)						Female (age) — Féminin (âge)

Italics: data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
[1] Including infant deaths of unknown age and sex.
[2] Including infant deaths of unknown age; excluding infant deaths of unknown sex.
[4] Data exclude live-born infants dying before registration of birth.
[8] For 1-5 calendar months inclusive.
[16] For under 1 calendar month.
[17] For 7 days to under 1 calendar month.
[39] Rates computed on live births tabulated by year of registration.
[40] For 1-11 calendar months inclusive.
[41] Inclusion of infants dying before registration of birth (which are registered as "stillbirths" although they are known to have breathed) produces rates for 1952-1957 and 1959 of 75.6, 60.0, 59.6, 64.8, 51.6, 55.7 and 51.3, respectively. Inclusion of an additional number of "stillbirths" whose ability to breathe was not reported would increase rates for the same period to 84.3 80.4, 79.8, 83.3, 67.0, 62.1 and 58.4, respectively.
[42] Inclusion of deaths of infants dying before registration of birth (which are registered as "stillbirths" although they are known to have breathed) produces rates for 1952-1959 of 66.5, 58.2, 53.9, 60.4, 55.1, 53.5, 60.5 and 50.2, respectively. Inclusion of an additional number of "stillbirths" whose ability to breathe was not reported would increase rates for the same period to 79.2, 66.5, 64.2, 70.3, 63.3, 67.1, 71.8 and 59.0, respectively.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
† Données selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'enfants d'âge et sexe inconnus.
[2] Y compris les décès d'enfants d'âge inconnu et non compris les décès d'enfants de sexe inconnu.
[4] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[8] 1-5 mois civils inclusivement.
[16] Moins de 1 mois civil.
[17] 7 jours-moins de 1 mois civil inclusivement.
[39] Taux calculés sur la base des naissances vivantes, classées selon l'année d'enregistrement.
[40] 1-11 mois civils inclusivement.
[41] Compte tenu des décès d'enfants survenus avant l'enregistrement de la naissance (ces enfants sont classés parmi les "mort-nés" bien que l'on sache qu'ils ont respiré), les taux pour les années 1952-1957 et 1959 s'établissent comme suit: 75,6; 60,0; 59,6; 64,8; 51,6; 55,7 et 51,3, respectivement. Compte tenu du nombre supplémentaire des "mort-nés" dont on ignore s'ils ont pu respirer, les taux correspondants s'établissent comme suit: 84,3; 80,4; 79,8; 83,3; 67,0; 62,1 et 58,4, respectivement.
[42] Compte tenu des décès d'enfants survenus avant l'enregistrement de leur naissance (ces enfants sont classés parmi les "mort-nés" bien que l'on sache qu'ils ont respiré), les taux pour les années 1952-1959 s'établissent comme suit: 66,5; 58,2; 53,9; 60,4; 55,1; 53,5; 60,5 et 50,2, respectivement. Compte tenu du nombre supplémentaire de "mort-nés" dont on ignore s'ils ont pu respirer, les taux correspondants s'établissent comme suit: 79,2; 66,5; 64,2; 70,3; 63,3; 67,1, 71,8 et 59,0, respectivement.

13. Infant mortality rates by age and sex (continued) — Taux de mortalité infantile selon l'âge et le sexe (suite)

Italics: data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
[1] Including infant deaths of unknown age and sex.
[2] Including infant deaths of unknown age; excluding infant deaths of unknown sex.
[8] For 1-5 calendar months inclusive.
[16] For under 1 calendar month.
[17] For 7 days to under 1 calendar month.
[37] Reason for slight discrepancy between this and corresponding rate shown in Table 12 not ascertained.
[43] For 1956-1958 and 1960, data are for Aruba, Bonaire and Curaçao only and for 1959 for Aruba and Curaçao only. Except for Curaçao since 1957, data exclude live-born infants dying before registration of birth. Rates computed on live births which include those among residents outside the country if listed in Netherlands Antilles register.
[44] Excluding tribal Indian population, numbering 48 654 in 1950 and 60 540 in 1960, and also data for Canal Zone, shown separately above.
[45] Rates computed on births estimated from a 50 per cent sample.
[46] Excluding Hawaii and, prior to 1959, Alaska.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
† Données selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'enfants d'âge et sexe inconnus.
[2] Y compris les décès d'enfants d'âge inconnu et non compris les décès d'enfants de sexe inconnu.
[8] 1-5 mois civils inclusivement.
[16] Moins de 1 mois civil.
[17] 7 jours-moins de 1 mois civil inclusivement.
[37] On ne sait pas comment s'explique la légère divergence entre ce taux et le taux correspondant qui figure dans le tableau 12.
[43] 1956-1958 et 1960: Aruba, Bonaire et Curaçao seulement. Depuis 1957, non compris, sauf pour Curaçao, les enfants nés vivants décédés avant l'enregistrement de leur naissance. Taux calculés sur la base des naissances vivantes survenues parmi les résidents se trouvant hors du pays, s'ils sont incrits sur un registre de population des Antilles néerlandaises.
[44] Non compris les Indiens vivant en tribus au nombre de 48 654 et 1950 et *60 540 en 1960. Non compris la zone du Canal, qui fait l'objet d'une rubrique distincte (voir plus haut).
[45] Taux calculés sur la base d'une estimation des naissances établie à partir d'un échantillon de 50 pour 100.
[46] Non compris Hawaii et pour les années antérieures à 1959, non compris l'Alaska.

13. Infant mortality rates by age and sex (continued) — Taux de mortalité infantile selon l'âge et le sexe (suite)

Italics: data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Including infant deaths of unknown age and sex.
[2] Including infant deaths of unknown age; excluding infant deaths of unknown sex.
[8] For 1-5 calendar months inclusive.
[16] For under 1 calendar month.
[17] For 7 days to under 1 calendar month.
[37] Reason for slight discrepancy between this and corresponding rate shown in Table 12 not ascertained.
[40] For 1-11 calendar months inclusive.
[47] Prior to 21 April 1960, known as Rio de Janeiro (Federal District).
[48] Beginning 1953, excluding Amerindians, shown separately below.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'enfants d'âge et sexe inconnus.
[2] Y compris les décès d'enfants d'âge inconnu et non compris les décès d'enfants de sexe inconnu.
[8] 1-5 mois civils inclusivement.
[16] Moins de 1 mois civil.
[17] 7 jours-moins de 1 mois civil inclusivement.
[37] On ne sait pas comment s'explique la légère divergence entre ce taux et le taux correspondant qui figure dans le tableau 12.
[40] 1-11 mois civils inclusivement.
[47] Antérieurement au 20 avril 1960, connu sous le nom de Rio de Janeiro (District fédéral).
[48] A partir de 1953, non compris les Amérindiens qui font l'objet d'une rubrique distincte (voir plus bas).

13. Infant mortality rates by age and sex (continued) — Taux de mortalité infantile selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

Continent, country and year Continent, pays et année	Both sexes (age) — Les deux sexes (âge)						Male (age) — Masculin (âge)						Female (age) — Féminin (âge)

Italics: data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Including infant deaths of unknown age and sex.
[2] Including infant deaths of unknown age; excluding infant deaths of unknown sex.
[8] For 1-5 calendar months inclusive.
[15] For 7-11 calendar months inclusive.
[16] For under 1 calendar month.
[17] For 7 days to under 1 calendar month.
[22] For 28 days to 6 calendar months inclusive.
[37] Reason for slight discrepancy between this and corresponding rate shown in Table 12 not ascertained.
[40] For 1-11 calendar months inclusive.
[49] Rates computed on live births which have been adjusted for underregistration; for details, see Table 6.
[50] Computed on births excluding adjustment for underregistration.
[51] Infant deaths are number of burial permits and rates are computed on number of baptisms recorded in Catholic church registers.
[52] For 7-29 days inclusive.
[53] For 30 days to 5 calendar months inclusive.
[54] For 30 days to 11 calendar months inclusive.
[55] Excluding Indian jungle population.
[56] Excluding Galápagos Islands.
[57] Data exclude live-born infants dying before registration of birth. Frequencies for both sexes for 1952-1959 are *54, 45, 41, 63, 40, 40, 46 and 62, respectively.
[58] Excluding Indian jungle population, estimated at 350 000 in 1940.
[59] Excluding Indian jungle population, numbering 56 705 in 1950 and estimated at 31 800 in 1961.
[60] Infant deaths tabulated by year of occurrence but rates computed on live births tabulated by year of registration.
[61] Excluding dependencies.
[62] Data are for 50 towns only.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'enfants d'âge et sexe inconnus.
[2] Y compris les décès d'enfants d'âge inconnu et non compris les décès d'enfants de sexe inconnu.
[8] 1-5 mois civils inclusivement.
[15] 7-11 mois civils inclusivement.
[16] Moins de 1 mois civil.
[17] 7 jours-moins de 1 mois civil inclusivement.
[22] 28 jours-6 mois civils inclusivement.
[37] On ne sait pas comment s'explique la légère divergence entre ce taux et le taux correspondant qui figure dans le tableau 12.
[40] 1-11 mois civils inclusivement.
[49] Taux calculés d'après le nombre des naissances vivantes ajusté pour tenir compte des lacunes de l'enregistrement. Pour plus de détails, voir le tableau 6.
[50] Taux calculés d'après le nombre des naissances sans tenir compte des lacunes de l'enregistrement.
[51] Le nombre des décès d'enfants de moins de 1 an est celui des permis d'inhumer. Taux calculés d'après le nombre des baptêmes inscrits sur les registres de l'Eglise catholique.
[52] 7-29 jours inclusivement.
[53] 30 jours-5 mois civils inclusivement.
[54] 30 jours-11 mois civils inclusivement.
[55] Non compris les Indiens de la jungle.
[56] Non compris les îles Galapagos.
[57] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance. Pour l'ensemble des deux sexes, la somme des données pour les années 1952-1959 s'établit à *54, 45, 41, 63, 40, 40, 46 et 62, respectivement.
[58] Non compris les Indiens de la jungle, au nombre de 350 000 en 1940.
[59] Non compris les Indiens de la jungle au nombre de 56 705 en 1950 et estimés à 31 800 en 1961.
[60] Décès d'enfants de moins de 1 an classés selon l'année de l'événement; toutefois, les taux ont été calculés sur la base des naissances vivantes classés selon l'année de l'enregistrement.
[61] Non compri les dépendances.
[62] Les données se rapportent à 60 villes seulement.

13. Infant mortality rates by age and sex (continued) — Taux de mortalité infantile selon l'âge et le sexe (suite)

Italics: data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Including infant deaths of unknown age and sex.
[2] Including infant deaths of unknown age; excluding infant deaths of unknown sex.
[4] Data exclude live-born infants dying before registration of birth.
[8] For 1-5 calendar months inclusive.
[14] For 1-6 calendar months inclusive.
[15] For 7-11 calendar months inclusive.
[16] For under 1 calendar month.
[17] For 7 days to under 1 calendar month.
[63] Beginning 1955, data are estimates based on experience of 1952-1954.
[64] Data are for Jewish population only and exclude infant deaths of unknown age and sex, numbering 18.
[65] For under 2 days.
[66] For 2-6 days inclusive.
[67] Excluding Bedouin population in the Negev.
[68] Data are for Japanese nationals in Japan only. Prior to May 1952, excluding Tokara Archipelago and prior to 1954, Amami Islands, both acquired from the Ryukyu Islands on 5 December 1951 and 25 December 1953, respectively.
[69] Excluding foreigners but including registered Palestinian refugees; for number of refugees, see Table 4. Infant deaths include late foetal deaths but rates computed on live births.
[70] Rates are based on incomplete returns; in 1952, reports were received from only 66 per cent of local registrars; in 1956-1959, from 78, 81, 84 and 84 per cent, respectively.
[70a] Excluding *concelho* of Nagar-Aveli (population 41 532 in 1950).
[71] Excluding Allied military and civilian personnel and their dependants stationed in the area.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'enfants d'âge et sexe inconnus.
[2] Y compris les décès d'enfants d'âge inconnu et non compris les décès d'enfants de sexe inconnu.
[4] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[8] 1-5 mois civils inclusivement.
[14] 1-6 mois civils inclusivement.
[15] 7-11 mois civils inclusivement.
[16] Moins de 1 mois civil.
[17] 7 jours-moins de 1 mois civil inclusivement.
[63] A partir de 1955, estimation fondée sur les résultats d'une évaluation concernant les données 1952-1954.
[64] Population juive seulement. Non compris les décès d'enfants d'âge et de sexe inconnus, au nombre de 18.
[65] Moins de 2 jours.
[66] 2-6 jours inclusivement.
[67] Non compris les Bédouins du Négeb.
[68] Ne concerne que les nationaux japonais se trouvant au Japon. Pour la période antérieure à mai 1952, non compris l'archipel des Tokara et, pour les années antérieures à 1954, les îles Amami, détachées des îles Ryû-kyû et rattachées au Japon le 5 décembre 1951 et le 25 décembre, respectivement.
[69] Non compris les étrangers, mais y compris les réfugiés de Palestine immatriculés; pour leur nombre, voir le tableau 4. Les nombres absolus comprennent les morts fœtales tardives; toutefois, les taux ont été calculés sur la base des naissances vivantes.
[70] Données incomplètes; en 1952, des bulletins ont été reçus de 66 pour 100 des bureaux d'état civil; en 1956-1959, de 78, 81, 84 et 84 pour 100, respectivement.
[70a] Non compris le *concelho* de Nagar-Aveli (population 41 532 en 1950).
[71] Non compris les militaires et agents civils alliés en poste sur le territoire, ni les membres de leur famille les accompagnant.

13. Infant mortality rates by age and sex (continued) — Taux de mortalité infantile selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

Continent, country and year Continent, pays et année	Both sexes (age) — Les deux sexes (âge)						Male (age) — Masculin (âge)						Female (age) — Féminin (âge)

Italics: data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Including infant deaths of unknown age and sex.
[2] Including infant deaths of unknown age; excluding infant deaths of unknown sex.
[8] For 1-5 calendar months inclusive.
[17] For 7 days to under 1 calendar month.
[72] Beginning 1953, rates computed on live births tabulated by date of occurrence.
[73] Excluding non-locally domiciled military and civilian services personnel and their dependants.
[74] For 1-4 days inclusive.
[75] For 5 days to under 1 calendar month.
[76] For 5-24 days inclusive.
[77] For 25 days to 5 calendar months inclusive.
[78] Beginning 1953, data exclude infants born alive after less than 28 weeks' gestation, of less than 1 000 grammes in weight and 35 centimetres in length, who die within 24 hours of birth.
[79] Excluding Faeroe Islands and Greenland.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'enfants d'âge et sexe inconnus.
[2] Y compris les décès d'enfants d'âge inconnu et non compris les décès d'enfants de sexe inconnu.
[8] 1-5 mois civils inclusivement.
[17] 7 jours-moins de 1 mois civil inclusivement.
[72] A partir de 1953, taux calculés sur la base des naissances vivantes classées selon la date de l'événement.
[73] Non compris les militaires et les agents civils domiciliés en dehors du territoire, ni les membres de leur famille les accompagnant.
[74] 1-4 jours inclusivement.
[75] 5 jours-moins de 1 mois civil.
[76] 5-24 jours inclusivement.
[77] 25 jours-5 mois civils inclusivement.
[78] A partir de 1953, non compris les enfants nés vivants après moins de 28 semaines de gestation, pesant moins de 1 000 grammes, mesurant moins de 35 centimètres et décédés dans les 24 heures qui ont suivi leur naissance.
[79] Non compris les îles Féroé et le Groenland qui font l'objet de rubriques distinctes.

13. Infant mortality rates by age and sex (continued) — Taux de mortalité infantile selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

Italics: data are unreliable or of unknown completeness.

* Provisional.

[1] Including infant deaths of unknown age and sex.

[2] Including infant deaths of unknown age; excluding infant deaths of unknown sex.

[16] Note suppressed.

[80] Including nationals temporarily outside country.

[81] Data exclude live-born infants dying before registration of birth. For infant mortality rates including these, see Table 12.

[82] Classification by age based on difference between date of birth and date of death, rather than on completed hours or days of life. This procedure tends to understate frequencies in "under 1 day" and to overstate those in "1-6 days".

[83] For 1-10 days inclusive.

[84] For 11-28 days inclusive.

[85] For 29 days to 5 calendar months inclusive.

[86] For 29 days to 3 calendar months inclusive.

[87] For 4-11 calendar months inclusive.

[88] For under 11 days.

[89] For 11-27 days inclusive.

[90] For 28 days to 3 calendar months inclusive.

[91] Including residents of the Federal Republic of Germany temporarily in West Berlin, and excluding alien armed forces and non-resident civilians temporarily in the area.

[92] Except for under 1 day, classification by age based on difference between date of birth and date of death, rather than on completed days of life.

[93] For Saar, data tabulated for 7-29 days and 30 days to 5 calendar months, as appropriate.

[94] Note suppressed.

[95] Including residents of West Berlin temporarily in the Federal Republic of Germany and excluding alien armed forces and non-resident civilians temporarily in the area.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.

* Données provisoires.

[1] Y compris les décès d'enfants d'âge et sexe inconnus.

[2] Y compris les décès d'enfants d'âge inconnu et non compris les décès d'enfants de sexe inconnu.

[16] Note supprimée.

[80] Y compris les nationaux temporairement en dehors du pays.

[81] Non compris les enfants nés vivants, décédés avant l'enregistrement de leur naissance. Pour les taux de mortalité infantile calculés sur la base d'un chiffre comprenant ces naissances, voir le tableau 12.

[82] Pour les décès d'enfants de moins de 1 an, le classement selon l'âge repose sur la différence entre la date du décès et celle de la naissance et non sur l'âge en heures ou jours révolus. Cette méthode tend à introduire une erreur par défaut dans les données relatives au groupe "moins de 1 jour" et une erreur par excès dans le groupe "1 jour-6 jours".

[83] 1-10 jours inclusivement.

[84] 11-28 jours inclusivement.

[85] 29 jours-9 mois civils inclusivement.

[86] 29 jours-3 mois civils inclusivement.

[87] 4-11 mois civils inclusivement.

[88] Moins de 11 jours.

[89] 11-27 jours inclusivement.

[90] 28 jours-3 mois civils inclusivement.

[91] Y compris les événements survenus parmi les résidents de la République fédérale d'Allemagne se trouvant temporairement à Berlin-Ouest, mais non compris ceux survenus dans les familles des militaires étrangers et des civils non résidents se trouvant temporairement sur le territoire.

[92] Pour les décès d'enfants de moins de 1 jour, le classement selon l'âge repose sur la différence entre la date de la naissance et celle du décès et non sur l'âge en jours révolus.

[93] Classement adopté pour la Sarre: 7-29 jours et 30 jours-5 mois civils.

[94] Note supprimée.

[95] Y compris les événements survenus parmi les résidents de Berlin-Ouest se trouvant temporairement dans la République fédérale d'Allemagne, mais non compris ceux survenus dans les familles des militaires étrangers et des civils non résidents se trouvant temporairement à Berlin-Ouest.

13. Infant mortality rates by age and sex (continued) — Taux de mortalité infantile selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Including infant deaths of unknown age and sex.
[2] Including infant deaths of unknown age; excluding infant deaths of unknown sex.
[8] For 1-5 calendar months inclusive.
[16] For under 1 calendar month.
[17] For 7 days to under 1 calendar month.
[49] Rates computed on live births which have been adjusted for underregistration; for details, see Table 6.
[52] For 7-29 days inclusive.
[53] For 30 days to 5 calendar months inclusive.
[82] Classification by age based on difference between date of birth and date of death, rather than on completed hours or days of life. This procedure tends to understate frequencies in "under 1 day" and to overstate those in "1-6 days".
[96] For 7-30 days inclusive.
[97] For 31 days to 5 calendar months inclusive.
[98] Data are events registered within one year of occurrence.
[99] Excluding that part of the former Free Territory of Trieste incorporated in October 1954.
[100] Including residents outside country if listed in a Netherlands population register. Prior to 1959, excluding Amboynese living in camps.
[101] Including infant deaths among Norwegian residents temporarily outside country.

* Données provisoires.
† Données selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'enfants d'âge et sexe inconnus.
[2] Y compris les décès d'enfants d'âge inconnu et non compris les décès d'enfants de sexe inconnu.
[8] 1-5 mois civils inclusivement.
[16] Moins de 1 mois civil.
[17] 7 jours-moins de 1 mois civil inclusivement.
[49] Taux calculés d'après le nombre des naissances vivantes ajusté pour tenir compte des lacunes de l'enregistrement. Pour plus de détails, voir le tableau 6.
[52] 7-29 jours inclusivement.
[53] 30 jours-5 mois civils inclusivement.
[82] Pour les décès d'enfants de moins de 1 an, le classement selon l'âge repose sur la différence entre la date du décès et celle de la naissance et non sur l'âge en heures ou jours révolus. Cette méthode tend à introduire une erreur par défaut dans les données relatives au groupe "moins de 1 jour" et une erreur pas excès dans le groupe "1 jour-6 jours".
[96] 7-30 jours inclusivement.
[97] 31 jours-5 mois civils inclusivement.
[98] Evénements enregistrés dans l'année qui suit chacun d'eux.
[99] Non compris la partie de l'ancien Territoire libre de Trieste attribuée à la Yougoslavie en octobre 1954.
[100] Y compris les événements survenus parmi les résidents hors du territoire, à la condition qu'ils aient été inscrits sur un registre de population néerlandais. Pour les années antérieures à 1959, non compris les événements survenus parmi les Amboinais vivant dans des camps.
[101] Y compris les décès d'enfants survenus parmi les résidents norvégiens se trouvant temporairement hors du pays.

13. Infant mortality rates by age and sex (continued) — Taux de mortalité infantile selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Including infant deaths of unknown age and sex.
[2] Including infant deaths of unknown age; excluding infant deaths of unknown sex.
[8] For 1-5 calendar months inclusive.
[14] For 1-6 calendar months inclusive.
[15] For 7-11 calendar months inclusive.
[16] For under 1 calendar month.
[17] For 7 days to under 1 calendar month.
[18] For under 2 calendar months.
[19] For 2-5 calendar months inclusive.
[27] For 1 day to under one calendar month.
[49] Rates computed on live births which have been adjusted for underregistration; for details, see Table 6.
[52] For 7-29 days inclusive.
[53] For 30 days to 5 calendar months inclusive.
[102] For 1-9 days inclusive.
[103] For 10-29 days inclusive.
[104] For 7 days to under 2 calendar months.
[105] For 2-6 calendar months inclusive.
[106] For 30 days to 6 calendar months inclusive.
[107] For 28 days to 4 calendar months inclusive.
[108] For 5-11 calendar months inclusive.
[109] Rates computed on live births tabulated by date of occurrence.

* Données provisoires.
† Données selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'enfants d'âge et sexe inconnus.
[2] Y compris les décès d'enfants d'âge inconnu et non compris les décès d'enfants de sexe inconnu.
[8] 1-5 mois civils inclusivement.
[14] 1-6 mois civils inclusivement.
[15] 7-11 mois civils inclusivement.
[16] Moins de 1 mois civil.
[17] 7 jours-moins de 1 mois civil inclusivement.
[18] Moins de deux mois civils.
[19] 2-5 mois civils inclusivement.
[27] 1 jour-moins de 1 mois civil.
[49] Taux calculés d'après le nombre des naissances vivantes ajusté pour tenir compte des lacunes de l'enregistrement. Pour plus de détails, voir le tableau 6.
[52] 7-29 jours inclusivement.
[53] 30 jours-5 mois civils inclusivement.
[102] 1-9 jours inclusivement.
[103] 10-29 jours inclusivement.
[104] 7 jours-moins de 2 mois civils.
[105] 2-6 mois civils inclusivement.
[106] 30 jours-6 mois civils inclusivement.
[107] 28 jours-4 mois civils inclusivement.
[108] 5-11 mois civils inclusivement.
[109] Taux calculés sur la base des naissances vivantes classées selon la date de l'événement.

13. Infant mortality rates by age and sex (continued) — Taux de mortalité infantile selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

Italics: data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Including infant deaths of unknown age and sex.
[2] Including infant deaths of unknown age; excluding infant deaths of unknown sex.
[8] For 1-5 calendar months inclusive.
[16] For under 1 calendar month.
[17] For 7 days to under 1 calendar month.
[37] Reason for slight discrepancy between this and corresponding rate shown in Table 12 not ascertained.
[110] Excluding Koper and Buje, that part of the former Free Territory of Trieste incorporated in October 1954.
[111] Excluding full-blooded aborigines, estimated at 39 319 in June 1954.
[112] Prior to 1958, data are for years ended 31 March.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'enfants d'âge et sexe inconnus.
[2] Y compris les décès d'enfants d'âge inconnu et non compris les décès d'enfants de sexe inconnu.
[8] 1-5 mois civils inclusivement.
[16] Moins de 1 mois civil.
[17] 7 jours-moins de 1 mois civil inclusivement.
[37] On ne sait pas comment s'explique la légère divergence entre ce taux et le taux correspondant qui figure dans le tableau 12.
[110] Non compris Koper et Buje, qui constituent la partie de l'ancien Territoire libre de Trieste attribuée à la Yougoslavie en octobre 1954.
[111] Non compris les aborigènes purs, au nombre de 39 319 en juin 1954 (estimation).
[112] Pour les années antérieures à 1958, les données se rapportent à des périodes annuelles se terminant le 31 mars.

13. Infant mortality rates by age and sex (continued) — Taux de mortalité infantile selon l'âge et le sexe (suite)

Italics: data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Including infant deaths of unknown age and sex.
[2] Including infant deaths of unknown age; excluding infant deaths of unknown sex.
[8] For 1-5 calendar months inclusive.
[17] For 7 days to under 1 calendar month.
[113] Excluding United States military personnel, their dependants and contract employees.
[114] Excluding Rota and outlying islands of the Yap district.
[115] Tongan population only.
[116] Samoan population only.
[117] Data include late foetal deaths among Samoan population.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'enfants d'âge et sexe inconnus.
[2] Y compris les décès d'enfants d'âge inconnu et non compris les décès d'enfants de sexe inconnu.
[8] 1-5 mois civils inclusivement.
[17] 7 jours-moins de 1 mois civil inclusivement.
[113] Non compris les décès survenus dans les familles des militaires des Etats-Unis, des membres de leur famille les accompagnant et des agents contractuels des Etats-Unis.
[114] Non compris Rota ni les îles périphériques du district de Yap.
[115] Togans seulement.
[116] Samoans seulement.
[117] Y compris les morts fœtales tardives survenues dans la population samoane.

14. Deaths, 1952-1961, and crude death rates, 1945-59 and 1952-1961

[Data exclude foetal deaths. Rates are the number of deaths per 1 000 population. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 32.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[2] Including the two Departments of the Sahara.
[3] Data exclude deaths of infants dying before registration of birth.
[4] Excludes data for armed forces.
[5] Four-year average.
[6] Two-year average.
[7] Excludes deaths among armed forces but rate computed on population including military personnel.
[8] For 1955-60. Estimated rate, based on results of sample surveys.
[9] European, Indian and Coloured (mixed) population, together comprising about one per cent of the total.
[10] Three-year average.
[11] Rate(s) not computed by the Statistical Office of the United Nations.
[12] For European population only.
[13] Note suppressed.
[14] Excluding Southern Cameroons, which was formerly a part of United Nations Trust Territory of the Cameroons under British Administration and which became part of the Republic of Cameroun on 1 October 1961.
[15] Unusually high rate attributable to effect of drought and epidemics.
[16] For indigenous population only.
[17] For 1953.
[18] For 1959.
[19] Estimated rate for Centre Oubangui, based on results of 1959 demographic sample survey of 167 clusters of villages and one urban centre.
[20] Data include late foetal deaths.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[2] Y compris les deux départements du Sahara.
[3] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[4] Non compris les forces armées.
[5] Moyenne pour quatre ans.
[6] Moyenne pour deux ans.
[7] Non compris les décès de militaires; taux calculé sur la base d'un chiffre de population qui comprend les militaires.
[8] 1955-60. Taux estimatif obtenu à partir des résultats d'enquêtes par sondage.
[9] Européens, personnes d'origine indienne et personnes de couleur (métis) représentant ensemble 1 pour cent environ de la population totale.
[10] Moyenne pour trois ans.
[11] Le calcul de ce(s) taux n'a pas été fait au Bureau de statistique des Nations Unies.
[12] Population européenne seulement.
[13] Note supprimée.
[14] Non compris le Cameroun méridional qui faisait précédemment partie du Territoire sous tutelle du Cameroun sous administration britannique et qui est devenu partie intégrante de la République du Cameroun le 1er octobre 1961.
[15] Taux anormalement élevé attribuable aux effets de la sécheresse et d'épidémies.
[16] Population indigène seulement.
[17] 1953.
[18] 1959.
[19] Taux estimatif concernant la population du Centre-Oubangui; ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage effectuée en 1959 dans 167 grappes de villages et un centre urbain.
[20] Y compris les morts fœtales tardives.

14. Décès 1952-1961 et taux bruts de mortalité 1945-59 et 1952-1961

[Les données ne comprennent pas les morts fœtales. Les taux représentent le nombre de décès pour 1 000 habitants. Les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et les insuffisances des données, voir Notes Techniques, page 84.]

[21] Estimated rate, based on results of annual demographic sample survey; corresponding recorded rate for 1953 was 13.4.
[22] Prior to 1957, data include late foetal deaths.
[23] For indigenous population living outside main towns.
[24] For 1954.
[24a] Estimated rate, based on results of demographic sample survey(s).
[25] For 1955.
[26] Data are for a compulsory registration area of 36 towns and townships which comprised about 12 per cent of total population and is not representative of Ghana.
[27] For registration area only; registration in rest of country incomplete.
[27a] For 1951.
[28] Estimated rate, based on results of 1955 demographic sample survey of residents but computed on total population including non-residents.
[29] For 1956.
[30] Estimated rate for indigenous rural population, based on results of 1957-1958 demographic sample survey of 69 villages.
[31] For 1957.
[32] Estimated rate for Vallée du Niger (population estimated at 200,000), based on results of 1957-1958 demographic sample survey of 79 rural villages and 3 urban centres.
[33] Estimated rate, based on incomplete provisional results of June 1960-May 1961 demographic sample survey.
[34] Northern part of former Spanish Protectorate.
[35] Data exclude deaths of infants dying within 24 hours of birth.
[36] Civil registration system for Moslem population introduced 1 July 1954.
[37] The former French Protectorate.
[38] Rates computed on population excluding personnel in military establishments.

[21] Taux estimatif obtenu à partir des résultats d'une enquête démographique annuelle par sondage; 1953 : le taux correspondant calculé d'après les données de l'enregistrement est de 13,4.
[22] Pour les années antérieures à 1957, y compris les morts fœtales tardives.
[23] Population indigène vivant hors des villes principales.
[24] 1954.
[24a] Taux estimatif obtenu à partir des résultats de l'enquête démographique par sondage(s).
[25] 1955.
[26] Données se rapportant à une zone où l'enregistrement est obligatoire; cette zone se compose de 36 villes et municipalités comptant 12 pour 100 environ de la population totale et n'est pas représentative de l'ensemble du Ghana.
[27] Zone d'enregistrement seulement; enregistrement incomplet dans le reste du pays.
[27a] 1951.
[28] Taux estimatif obtenu à partir des résultats de l'enquête démographique par sondage de 1955 sur les résidents; toutefois, ce taux a pour base la population totale (y compris les non-résidents).
[29] 1956.
[30] Taux estimatif concernant la population indigène rurale; ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage effectuée en 1957-1958 dans 69 villages.
[31] 1957.
[32] Taux estimatif concernant la population de la vallée du Niger (estimée à 200 000 habitants); ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage effectuée en 1957-1958 dans 79 villages ruraux et 3 centres urbains.
[33] Taux estimatif obtenu à partir des résultats provisoires incomplets de l'enquête démographique par sondage de juin 1960-mai 1961.
[34] Partie nord de l'ancien Protectorat espagnol.
[35] Non compris les enfants décédés dans les 24 heures qui ont suivi la naissance.
[36] Un système d'enregistrement des faits d'état civil pour la population musulmane est entré en vigueur le 1er juillet 1954.
[37] Ancien Protectorat français.
[38] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires encasernés.

14. Deaths and crude death rates (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[3] Data exclude deaths of infants dying before registration of birth.
[5] Four-year average.
[6] Two-year average.
[10] Three-year average.
[17] For 1953.
[23] For indigenous population living outside main towns.
[24] For 1954.
[25] For 1955.
[31] For 1957.
[35] Data exclude deaths of infants dying within 24 hours of birth.
[39] Population which has fulfilled certain conditions established by law, i.e., achieved a prescribed degree of material and social development as measured by educational level, language used and mode of living.
[40] Registration believed to be complete for civilized population only, which represents a relatively small proportion of the total.
[41] For 1949.
[42] For 1950. Estimated rate, based on results of 1950 demographic sample survey.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[3] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[5] Moyenne pour quatre ans.
[6] Moyenne pour deux ans.
[10] Moyenne pour trois ans.
[17] 1953.
[23] Population indigène vivant hors des villes principales.
[24] 1954.
[25] 1955.
[31] 1957.
[35] Non compris les enfants décédés dans les 24 heures qui ont suivi la naissance.
[39] Population remplissant certaines conditions fixées par la loi, c'est-à-dire ayant atteint un degré de développement matériel et social déterminé du point de vue du niveau d'instruction, de la langue parlée et du mode de vie.
[40] L'enregistrement ne serait complet que pour la population "civilisée", qui représente une fraction relativement faible de la population totale.
[41] 1949.
[42] 1950. Taux estimatif obtenu à partir des résultats de l'enquête démographique par sondage de 1950.

14. Décès et taux bruts de mortalité (suite)

[43] For 1948. Estimated rate for African population, based on results of demographic sample survey.
[44] Estimated rate for African population in villages, based on results of 1953-1955 demographic sample survey.
[45] Note suppressed.
[46] Estimated rate, based on results of annual demographic sample survey(s).
[47] Estimated rate for Basse Vallée (population estimated at 250 000), based on results of 1957-1958 demographic sample survey of 77 rural villages and 5 urban centres.
[48] Former British dependency; declared independent 27 April 1961.
[49] For Freetown only.
[50] For Italian population of former Italian Somaliland only.
[51] Prior to 31 May 1961, known as Union of South Africa.
[52] Marked increase observed beginning 1953 due to extension of compulsory registration to native (Bantu) population in rural areas on 1 January 1952.
[53] Prior to 1958, including data for the southern part of former Spanish Protectorate of Morocco transferred to Morocco on 10 April 1958.
[54] For 1950.
[55] Estimate, based on results of 1955-1956 sample census of population.

[43] 1948. Taux estimatif concernant la population africaine; ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage.
[44] Taux estimatif concernant la population africaine des villages; ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage de 1953-1955.
[45] Note supprimée.
[46] Taux estimatif obtenu à partir des résultats d'une (ou de plusieurs) enquête(s) annuelle(s) démographique(s) par sondage.
[47] Taux estimatif concernant la population de la Basse Vallée (estimée à 250 000 habitants); ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage effectuée en 1957-1958 dans 77 villages ruraux et 5 centres urbains.
[48] Ancienne dépendance britannique; proclamée indépendante le 27 avril 1961.
[49] Freetown seulement.
[50] Population italienne de l'ancienne Somalie italienne seulement.
[51] Antérieurement au 31 mai 1961 connue sous le nom d'Union sud-africaine.
[52] Les augmentations sensibles observées depuis 1957 s'expliquent par l'extension, le 1er janvier 1952, d'un système d'enregistrement obligatoire pour les indigènes (Bantous) des régions rurales.
[53] Antérieurement à 1958, y compris la partie sud de l'ancien Protectorat espagnol du Maroc, cédée au Maroc le 10 avril 1958.
[54] 1950.
[55] Estimation établie à partir des résultats du recensement par sondage de la population, effectué en 1955-1956.

14. Deaths and crude death rates (continued)

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[3] Data exclude deaths of infants dying before registration of birth.
[5] Four-year average.
[10] Three-year average.
[23] For indigenous population living outside main towns.
[24] For 1954.
[25] For 1955.
[31] For 1957.
[35] Data exclude deaths of infants dying within 24 hours of birth.
[54] For 1950.
[56] For 1947. Estimated rate, based on results of 1948 sample census of population.
[57] Marked increase observed in 1955 due to extension of civil registration facilities in 1954.
[58] Estimated rate for Pays Kabré (population estimated at 150 000), based on results of 1957 demographic sample survey of 527 hamlets.
[59] Excluding Algerian refugees temporarily in the country, estimated at about 180 000 in 1959.
[59a] Death registration among Tunisian Moslem population only estimated to be only about 50 per cent complete.
[60] Estimated rate, basis unknown; corresponding recorded rate is 9.7.
[61] For 1946.
[62] For 1947. Estimated rate, based on results of 1948 sample census of population; average of corresponding recorded rates for 1947 and 1949 is 14.0.
[63] Between 21 February 1958 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only. The former Syrian Region, which seceded on that date, appears as "Syria" under Asia. Data shown here are for the former Egyptian Region.
[64] Death registration estimated to be 77 per cent complete in 1956.
[65] For localities having Health Bureaux, which comprised 43.7 per cent of total population in 1958.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[3] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[5] Moyenne pour quatre ans.
[10] Moyenne pour trois ans.
[23] Population indigène vivant hors des villes principales.
[24] 1954.
[25] 1955.
[31] 1957.
[35] Non compris les enfants décédés dans les 24 heures qui ont suivi la naissance.
[54] 1950.
[56] 1947. Taux estimatif obtenu à partir des résultats du recensement par sondage de la population, effectué en 1948.
[57] Les augmentations sensibles observées depuis 1955 s'expliquent par l'extension des services de l'état civil en 1954.
[58] Taux estimatif concernant la population du Pays Kabré (estimée à 150 000 habitants); ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage effectuée en 1957 dans 527 hameaux.
[59] Non compris les réfugiés algériens temporairement dans le pays, au nombre de 180 000 environ en 1959 (estimation).
[59a] L'enregistrement saisirait environ 50 pour 100 des décès de musulmans tunisiens.
[60] Taux estimatif; base inconnue; le taux correspondant calculé d'après les données de l'enregistrement est 9,7.
[61] 1946.
[62] 1947. Taux estimatif obtenu à partir des résultats de l'enquête par sondage de 1948 sur la population; la moyenne des taux correspondants calculés pour 1947 et 1949 d'après les données de l'enregistrement est de 14,0.
[63] 21 février 1958-29 septembre 1961 : Région égyptienne et Région syrienne. A partir du 29 septembre 1961, ancienne Région égyptienne seulement, l'ancienne Région syrienne ayant fait sécession à cette date, les données pertinentes figurent en regard de la rubrique "Syrie", sous la rubrique générale "Asie". Données se rapportent à l'ancienne Région égyptienne.
[64] 1956 : l'enregistrement saisirait environ 77 pour 100 des décès.
[65] Données concernant les localités dotées d'un bureau d'hygiène, qui comprenaient 43,7 pour 100 de la population totale en 1958.

14. Décès et taux bruts de mortalité (suite)

[65a] For 1960-61: estimated rate, based on results of October 1960-April 1961 demographic sample survey of indigeneous population of 226 villages and 12 urban centres, covering approximately 185 000 persons.

[66] Estimated rate for Afro-Arab population in Zanzibar, based on results of 1958 population census; corresponding rate for Pemba is 23. Corresponding recorded rate for Zanzibar and Pemba is 6.7.

[67] Excluding tourists and United Kingdom and United States armed forces and their dependants stationed in the area.

[68] Prior to 1956, data tabulated by year of registration rather than occurrence.

[69] Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.

[70] Estimated average annual rate for 1943-53 based on demographic analysis of 1943 and 1953 census returns; recorded average rates for 1945-49 and 1950-54 are 8.3 and 6.6, respectively.

[71] Published by the World Health Organization Regional Office for the Americas.

[72] Prior to 1951, data tabulated by year of registration rather than occurrence.

[73] Unusually high rate attributable to effect of epidemic of whooping cough in 1949.

[74] Inclusion of deaths of infants dying before registration of birth (which are registered as "stillbirths" although they are known to have breathed) produces rates for 1951-1957 and 1959 of 13.9, 15.1, 13.2, 11.8, 11.9, 10.3, 11.6 and 9.2, respectively. Inclusion of an additional number of "stillbirths" whose ability to breathe was not reported would increase rates for the same period to 14.9, 15.5, 14.0, 12.7, 12.8, 10.9, 11.8 and 9.5, respectively.

[75] Death registration estimated to be 75-85 per cent complete.

[76] Inclusion of deaths of infants dying before registration of birth (which are registered as "stillbirths" although they are known to have breathed) produces rates for 1951-1959 of 15.2, 14.3, 10.9, 10.8, 11.1, 10.2, 10.1, 10.6 and 8.9, respectively. Inclusion of an additional number of "stillbirths" whose ability to breathe was not reported would increase rates for the same period to 16.0, 14.8, 11.2, 11.2, 11.5, 10.6, 10.6, 11.1, and 9.2, respectively.

[65a] 1960-61 : taux estimatif concernant la population indigène; ce taux a été obtenu à partir des résultats de l'enquête démographique par sondage effectuée en octobre 1960-avril 1961 dans 226 villages et 12 centres urbains couvrant approximativement 185 000 personnes.

[66] Taux estimatif concernant la population africano-arabe de Zanzibar; ce taux a été obtenu à partir des résultats du recensement de population de 1958. Pour Pemba, le taux correspondant est de 23. Le taux correspondant calculé d'après les données de l'enregistrement pour Zanzibar et Pemba est de 6,7.

[67] Non compris les décès survenus parmi les touristes ni parmi les militaires du Royaume-Uni et des Etats-Unis en garnison sur le territoire, et les membres de leur famille les accompagnant.

[68] Pour les années antérieures à 1956, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[69] Y compris les décès de résidents canadiens se trouvant temporairement aux Etats-Unis, mais non compris les décès de résidents des Etats-Unis se trouvant temporairement au Canada.

[70] Taux annuel moyen estimatif pour 1943-53, obtenu à partir des résultats de l'analyse démographique des recensements de 1943 et de 1953; la moyenne des taux calculés d'après les données de l'enregistrement pour 1945-49 et 1950-54, s'établit à 8,3 et 6,6 respectivement.

[71] Chiffres publiés par l'Organisation mondiale de la santé (Bureau régional des Amériques).

[72] Pour les années antérieures à 1951, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[73] Taux anormalement élevé attribuable aux effets de l'épidémie de coqueluche de 1949.

[74] Compte tenu des décès d'enfants survenus avant l'enregistrement de la naissance (ces enfants sont classés parmi les "mort-nés" bien que l'on sache qu'ils ont respiré), les taux pour les années 1951-1957 et 1959 s'établissent comme suit : 13,9; 15,1; 13,2; 11,8; 11,9; 10,3; 11,6 et 9,2 respectivement. Compte tenu du nombre supplémentaire des "mort-nés" dont on ignore s'ils ont pu respirer, les taux correspondants s'établissent comme suit : 14,9; 15,5; 14,0; 12,7; 12,8; 10,9; 11,8 et 9,5 respectivement.

[75] L'enregistrement saisirait de 75 à 85 pour 100 des décès.

[76] Compte tenu des décès d'enfants survenus avant l'enregistrement de la naissance (ces enfants sont classés parmi les "mort-nés" bien que l'on sache qu'ils ont respiré), les taux pour les années 1951-1959 s'établissent comme suit : 15,2; 14,3; 10,9; 10,8; 11,1; 10,2; 10,1; 10,6 et 8,9 respectivement. Compte tenu du nombre supplémentaire des "mort-nés" dont on ignore s'ils ont pu respirer, les taux correspondants s'établissent comme suit : 16,0; 14,8; 11,2; 11,2; 11,5; 10,6; 10,6; 11,1 et 9,2 respectivement.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[3] Data exclude deaths of infants dying before registration of birth.
[5] Four-year average.
[10] Three-year average.
[61] For 1946.
[77] Beginning 1950, including residents outside the country if listed in Netherlands Antilles population register. Except for Curaçao since 1957, data exclude deaths of infants dying before registration of birth.
[78] Data are for Aruba, Bonaire and Curaçao only.
[79] Excluding data for Canal Zone, shown separately above. Prior to 1952, excluding tribal Indian population, numbering 48 654 in 1950 and *60 540 in 1960. Beginning 1952, including tribal Indian population in Provinces of Bocas del Toro and Darién, where they constitute a relatively high proportion of the population (48.8 and 28.5 per cent, respectively).
[80] Three-year average. Average rate for 1950-54, excluding tribal Indian population, is 9.0.
[81] Prior to 1954, data tabulated by year of registration rather than occurrence.
[82] Unusually high rate attributable to effect of hurricane in 1945.
[82a] Revised provisional.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[3] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[5] Moyenne pour quatre ans.
[10] Moyenne pour trois ans.
[61] 1946.
[77] A partir de 1950, y compris les décès de résidents néerlandais se trouvant hors du pays s'ils sont inscrits sur un registre de population des Antilles néerlandaises, mais non compris les décès d'enfants survenus avant l'enregistrement de la naissance, excepté pour Curaçao depuis 1957.
[78] Aruba, Bonaire et Curaçao seulement.
[79] Non compris la Zone du Canal qui fait l'objet d'une rubrique distincte (voir plus haut). Pour les années antérieures à 1952, non compris les Indiens vivant en tribus (au nombre de 48 654 en 1950 et de *60 540 en 1960). A partir de 1952, y compris les Indiens vivant en tribus dans les Provinces de Bocas del Toro et de Darién, qui représentent une proportion relativement importante de la population (40,8 et 28,5 pour 100 respectivement).
[80] Moyenne pour trois ans. Le taux moyen pour 1950-54, calculé sur la base d'un chiffre ne comprenant pas les Indiens vivant en tribus, est de 9,0.
[81] Pour les années antérieures à 1954, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[82] Taux anormalement élevé attribuable aux effets de l'ouragan de 1945.
[82a] Données provisoires revisées.

14. Décès et taux bruts de mortalité (suite)

[Voir note au début du tableau.]

[83] Prior to 1948, data exclude deaths of infants dying within 24 hours of birth.
[84] Estimated average annual rate for 1940-50 for population born in Brazil, based on demographic analysis of 1940 and 1950 census returns.
[85] Excluding Amerindians, shown separately below.
[86] Data are burial permits.
[87] Excluding Indian jungle population. Prior to 1955, data exclude deaths in Galápagos Islands and, prior to 1954, also those in Provinces of Napo Pastaza, Morona Santiago and Zamora Chinchipe, but rates computed on total population.
[88] Registration estimated to be about 70 per cent complete in 1956. Prior to 1954, data tabulated by year of registration rather than occurrence.
[89] For 1950. Estimated rate, based on reports for 27 municipalities in which registration is believed to be complete.
[90] Excluding Indian jungle population, estimated at 350 000 in 1940.
[91] Excluding Indian and Negro population living in tribes, estimated at 22 000 in 1945, 26 000 in 1946-1958 and 38 000 in 1959.
[92] Excluding Indian jungle population, numbering 56 705 in 1950 and estimated at 31 800 in 1961.
[93] Prior to 1957, data tabulated by year of registration rather than occurrence.

[83] Pour les années antérieures à 1948, non compris les enfants décédés dans les 24 heures qui ont suivi leur naissance.
[84] Taux annuel moyen estimatif pour 1940-50 concernant la population née au Brésil; ce taux a été obtenu à partir des résultats d'une analyse démographique des recensements de 1940 et de 1950.
[85] Non compris les Amérindiens, qui font l'objet d'une rubrique distincte (voir plus bas).
[86] D'après les permis d'inhumer délivrés.
[87] Il n'est pas tenu compte des Indiens de la jungle. Non compris les décès survenus dans les îles Galapagos, pour les années antérieures à 1955, ni dans les Provinces de Napo Pastaza, de Morona Santiago et de Zamora Chinchipe, pour les années antérieures à 1954; toutefois, les taux ont été calculés sur la base de la population totale.
[88] 1956 : l'enregistrement saisirait environ 70 pour 100 des décès. Pour les années antérieures à 1954, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[89] 1950. Taux estimatif obtenu à partir des données fournies par 27 municipalités où l'on pense que l'enregistrement est complet.
[90] Non compris les Indiens de la jungle, au nombre de 350 000 en 1940 (estimation).
[91] Non compris les noirs et les Indiens vivant en tribus: 22 000 personnes en 1945, 26 000 en 1946-1958 et 38 000 en 1959 (estimations).
[92] Non compris les Indiens de la jungle, au nombre de 56 705 en 1950 et estimés à 31 800 en 1961.
[93] Pour les années antérieures à 1957, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

14. Deaths and crude death rates (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[3] Data exclude deaths of infants dying before registration of birth.
[5] Four-year average.
[6] Two-year average.
[10] Three-year average.
[11] Rate(s) not computed by the Statistical Office of the United Nations.
[20] Data include late foetal deaths.
[25] For 1955.
[41] For 1949.
[94] Excluding dependencies.
[95] Excluding deaths among armed forces and in port, but rates computed on population including them.
[96] Estimated rate; basis unknown.
[97] Data are for a changing number of towns having a present population of approximately 2 million.
[98] For year ended April 1959. Estimate, based on results of 1958-1959 demographic sample survey in 345 villages.
[99] Death registration estimated to be 89 per cent complete in 1953, according to results of post-censal sample survey.
[100] Rates are estimated, based on results of surveys and reports from areas where registration is considered satisfactory. Released by State Statistical Bureau, Peking, 1958.
[101] Excluding armed forces and, beginning 1949, foreigners.
[102] Excluding armed forces. Beginning 1955, data are estimates based on experience of 1952-1954.
[103] Rates computed on population excluding armed forces.
[104] Estimated average annual rate for 1941-51, based on demographic analysis of 1941 and 1951 census returns.
[105] Estimated rate for rural India; for 1953, based on 7th round and for 1958 on 14th round of National Sample Survey. Rate given for 1955-59 is for 1958 only.
[106] Data are for a changing group of states and territories which, in 1959, included a population of about 382 million.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[3] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[5] Moyenne pour quatre ans.
[6] Moyenne pour deux ans.
[10] Moyenne pour trois ans.
[11] Le calcul de ce(s) taux n'a pas été fait au Bureau de statistique des Nations Unies.
[20] Y compris les morts fœtales tardives.
[25] 1955.
[41] 1949.
[94] Non compris les dépendances.
[95] Non compris les décès de militaires et de passagers se trouvant à bord de navires dans le port et taux calculés sur la base d'un chiffre de population qui les comprend.
[96] Taux estimatif; base inconnue.
[97] Les données se rapportent à un nombre variable de villes qui comptent actuellement 2 millions d'habitants environ.
[98] Période annuelle se terminant en avril 1959. Estimation établie sur la base des résultats d'une enquête démographique par sondage effectuée en 1958-1959 dans 345 villages.
[99] Un sondage de vérification postcensitaire a permis d'établir que 89 pour 100 des décès ont été enregistrés en 1953.
[100] Taux estimatifs calculés à partir des rapports et résultats d'enquêtes concernant des zones où l'enregistrement est considéré comme satisfaisant. Source : Direction des statistiques, Pékin, 1958.
[101] Non compris les militaires et à partir de 1949 les étrangers.
[102] Non compris les militaires. A partir de 1955, estimation fondée sur les résultats d'une évaluation concernant les données pour 1952-1954.
[103] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires.
[104] Taux annuel moyen estimatif pour 1941-51 obtenu à partir des résultats de l'analyse démographique des recensements de 1941 et de 1951.
[105] Taux estimatif concernant la population rurale de l'Inde; ce taux a été obtenu à partir des résultats des 7ème et 14ème phases de l'Enquête nationale par sondage. Le taux indiqué pour 1955-59 ne se rapporte qu'à 1958.
[106] Les données se rapportent à un groupe variable d'Etats et de territoires qui, en 1959, comptaient 382 millions d'habitants environ.

14. Décès et taux bruts de mortalité (suite)

[Voir note au début du tableau.]

[107] Death registration estimated to be 69-72 per cent complete for period 1941-1951, according to demographic analysis of 1941 and 1951 census returns.
[108] For 1950 and 1953-54. Estimated rate; basis unknown. For 1950, rate is 20-25; for 1953-54, rate is less than 20.
[109] Data are for a changing number of regencies in Java which in 1959 included a population of about 54 million.
[110] Estimated average annual rate for Java for 1953-57, based on data for selected regencies where registration is believed to be fairly complete. Recorded rates for 1953-1957 are 13.5, 12.9, 12.7, 13.3 and 14.2, respectively.
[111] Prior to 1950, rates are for years ended 20 March of following year and by year of registration rather than occurrence. Beginning 1950, data are for years ended 21 December.
[112] Estimated rate, based on demographic analysis of results of 1956 census of population and subsequent national sample survey in 40 towns and 300 villages. Recorded rates for 1956-1959 are 7.7, 8.6, 8.9 and 8.7, respectively.
[113] Death registration estimated to be 60 per cent complete, and primarily urban in coverage.
[114] Prior to 1957 and for 1961, excluding Bedouin population in the Negev.
[115] Registration among non-Jewish population estimated to be less than 75 per cent complete in 1956.
[116] For Jewish population only.
[117] Data are for Japanese nationals in Japan only. Prior to May 1952, excluding Tokara Archipelago and, prior to 1954, Amami Islands, both acquired from the Ryukyu Islands on 5 December 1951 and 25 December 1953, respectively.
[118] Excluding foreigners but including registered Palestinian refugees. For number of refugees, see Table 4.
[119] Death registration estimated to be 80 per cent complete in 1955.
[120] Excluding alien armed forces, civilian aliens employed by armed forces, and foreign diplomatic personnel.
[121] Excluding non-resident foreigners and registered Palestinian refugees. For number of refugees, see Table 4.
[122] Data are deaths registered by Health Service only.

[107] L'analyse démographique des recensements de 1941 et de 1951 montre que l'enregistrement des décès saisirait environ 69 à 72 pour 100 des décès survenus pendant la période 1941-1951.
[108] 1950 et 1950-54. Taux estimatif; base inconnue. 1950 : le taux est de 20-25; 1953-54 : le taux est inférieur à 20.
[109] Les données se rapportent à un groupe variable de régences de Java qui, en 1959, comptaient 54 millions d'habitants environ.
[110] Taux estimatif pour 1953-57 calculé d'après des données relatives à certaines régences où l'on pense que l'enregistrement est relativement complet. Pour les années 1953-1957, les taux établis d'après les données d'enregistrement sont de 13,5; 12,9; 12,7; 13,3 et 14,2 respectivement.
[111] Pour les années antérieures à 1950, les taux se rapportent à des périodes annuelles se terminant le 20 mars de l'année suivante et sont établis d'après des données exploitées selon l'année de l'enregistrement et non l'année de l'événement. A partir de 1950, les données se rapportent à des périodes annuelles se terminant le 21 décembre.
[112] Taux estimatif obtenu à partir des résultats de l'analyse démographique du recensement de population de 1956 et d'une enquête nationale par sondage effectuée ultérieurement dans 40 villes et 300 villages. Pour les années 1956-1959, les taux établis d'après les données d'enregistrement sont de 7,7; 8,6; 8,9 et 8,7 respectivement.
[113] L'enregistrement saisirait environ 60 pour 100 des décès survenus principalement dans les régions urbaines.
[114] Pour les années antérieures à 1957 et pour 1961, non compris les Bédouins du Négeb.
[115] 1956 : l'enregistrement saisirait moins de 75 pour 100 des décès survenus dans la population non juive.
[116] Population juive.
[117] Ne concerne que les nationaux japonais se trouvant au Japon. Pour la période antérieure à mai 1952, non compris l'archipel des Tokara et, pour les années antérieures à 1954, les îles Amami, détachés des îles Ryû-kyû et rattachés au Japon le 5 décembre 1951 et le 25 décembre 1953 respectivement.
[118] Non compris les étrangers, mais y compris les réfugiés de Palestine immatriculés. Pour leur nombre, voir le tableau 4.
[119] 1955 : l'enregistrement saisirait environ 80 pour 100 des décès.
[120] Non compris les décès survenus parmi les militaires étrangers, les civils étrangers employés par les forces armées et les membres du corps diplomatique étranger.
[121] Il n'est pas tenu compte des décès survenus parmi les étrangers non résidents et parmi les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 4.
[122] Les données se rapportent uniquement aux décès enregistrés par le Service de la santé.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[3] Data exclude deaths of infants dying before registration of birth.
[5] Four-year average.
[6] Two-year average.
[10] Three-year average.
[11] Rate(s) not computed by the Statistical Office of the United Nations.
[24] For 1954.
[40] Registration believed to be complete for civilized population only, which represents a relatively small proportion of the total.
[41] For 1949.
[54] For 1950.
[61] For 1946.
[123] Estimated rate, based on demographic analysis of 1952-54 population census returns. Rate given for 1950-54 is for 1952-54 only.
[124] Data are for a changing registration area which in 1951 comprised about 90 per cent of total population.
[124a] Prior to 1951, data tabulated by year of occurrence.
[125] Beginning July 1954, excluding deaths in *concelho* of Nagar-Aveli (population 41 532 in 1950) but rates computed on total population.
[126] Excluding deaths among Allied military and civilian personnel and their dependants stationed in the area.
[127] Prior to 1955, data tabulated by year of registration rather than occurrence.
[128] Registration estimated to be about 80 per cent complete in 1952.
[129] Estimated rate, based on results of 6.2 per cent sample survey of population in 1 700 villages. Rate given for 1950-54 is for 1954 only.
[130] Rates computed on population excluding transients afloat and non-locally domiciled military and civilian services personnel and their dependants.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[3] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[5] Moyenne pour quatre ans.
[6] Moyenne pour deux ans.
[10] Moyenne pour trois ans.
[11] Le calcul de ce(s) taux n'a pas été fait au Bureau de statistique des Nations Unies.
[24] 1954.
[40] L'enregistrement ne serait complet que pour la population "civilisée", qui représente une fraction relativement faible de la population totale.
[41] 1949.
[54] 1950.
[61] 1946.
[123] Taux estimatif obtenu à partir des résultats de l'analyse démographique du recensement de population de 1952-54. Le taux figurant dans la colonne 1950-54 ne se rapporte qu'à la période 1952-54.
[124] Les données se rapportent à une zone d'enregistrement qui varie selon les années et qui comprenait en 1951 environ 90 pour 100 de la population totale.
[124a] Antérieurement à 1951, données classées selon l'année de l'événement.
[125] A partir de juillet 1954, non compris le *concelho* de Nagar-Aveli (population 41 532 en 1950); toutefois, ces taux ont pour base la population totale.
[126] Non compris les militaires et agents civils alliés en poste sur le territoire, ni les membres de leur famille les accompagnant.
[127] Pour les années antérieures à 1955, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[128] 1952 : l'enregistrement ne saisirait que 80 pour 100 environ des décès.
[129] Taux estimatif obtenu à partir des résultats d'une enquête par sondage portant sur 6,2 pour 100 de la population répartis dans 1 700 villages. Le taux figurant dans la colonne 1950-54 se rapporte à 1954 seulement.
[130] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les personnes de passage à bord de navires, ni les militaires et les agents civils domiciliés en dehors du territoire, ni les membres de leur famille les accompagnant.

14. Décès et taux bruts de mortalité (suite)

[131] Formerly Syrian Region of United Arab Republic; reverted to status of independent nation 29 September 1961. Excluding Palestinian refugees, numbering 124 261 on 1 July 1960; for number excluded 1950-1959, see Table 4. Data exclude also nomads, estimated at 179 722 at end of 1956, but rates computed on population including them. Data are deaths registered within one month of occurrence; additional late registrations made during year for 1956-1960 numbered 5 069, 5 214, 14 925, 21 110 and 15 546, respectively.

[132] Estimated average annual rate for 1947-56, based on demographic analysis of results of 1947 population census and 1956 Demographic and Economic Survey of Thailand. Recorded rate for 1956 is 9.8.

[133] Beginning March 1957, data are for provincial capitals and district centres.

[134] For March to December only.

[135] Data are for changing territory representing 61 per cent of total population in 1954 and 97 per cent in 1957.

[136] For 1948.

[137] Including armed forces stationed outside country but excluding alien armed forces stationed in the area.

[138] Rates computed on population excluding armed forces in Guernsey and dependencies.

[139] Beginning 1953, data exclude deaths of infants born alive after less than 28 weeks' gestation, of less than 1 000 grammes in weight and 35 centimetres in length, who die within 24 hours of birth.

[140] Excluding Faeroe Islands and Greenland, shown separately.

[141] Including armed forces stationed outside country.

[142] For 1945-1948, excludes data for civilian aliens living in Denmark without residence permits, numbering about 200 000 in 1945 and 2 500 at end of 1948.

[143] Prior to 1951, data are for Finnish nationals in Finland only, except that for 1950 rate is computed on population which includes resident aliens; beginning 1951, including also data for nationals temporarily outside country.

[131] Ancienne Région syrienne de la République arabe unie, redevenue Etat indépendant le 29 septembre 1961. Non compris les réfugiés de Palestine au nombre de 124 261 au 1er juillet 1960; pour le nombre des réfugiés omis chaque année de 1950 à 1959, voir le tableau 4. Non compris également la population nomade, soit 179 722 personnes à la fin de 1956; toutefois, les taux sont calculés sur la base d'un chiffre de population les comprenant. Les données représentent les décès enregistrés dans le mois qui suit l'événement; le nombre des autres décès qui ont fait l'objet d'un enregistrement tardif s'établit, pour chaque année de 1956 à 1960, comme suit : 5 069, 5 214, 14 925, 21 110 et 15 546 respectivement.

[132] Taux annuel moyen estimatif pour 1947-56 obtenu à partir des résultats de l'analyse démographique du recensement de population de 1947 et de l'Enquête démographique et économique thaïlandaise de 1956. Le taux correspondant calculé d'après les données de l'enregistrement est de 9,8 et se rapporte à 1956.

[133] A partir de mars 1957, les données se rapportent aux capitales de provinces et aux chefs-lieux de districts.

[134] Mars-décembre seulement.

[135] Les données se rapportent à des zones variables comptant 61 pour 100 et 97 pour 100 de la population totale en 1954 et 1957 respectivement.

[136] 1948.

[137] Y compris les militaires nationaux hors du pays, mais non compris les militaires étrangers en garnison sur le territoire.

[138] Taux calculés sur la base d'un chiffre de population ne comprenant pas les militaires en garnison à Guernesey et dans ses dépendances.

[139] A partir de 1953, il n'est pas tenu compte des enfants nés vivants après moins de 28 semaines de gestation, pesant moins de 1 000 grammes, mesurant moins de 35 centimètres et décédés dans les 24 heures qui ont suivi la naissance.

[140] Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.

[141] Y compris les décès de militaires hors du pays.

[142] 1945-1948 : non compris les civils étrangers résidant au Danemark sans permis de séjour, au nombre de 200 000 en 1945 et de 2 500 à la fin de 1948.

[143] Pour les années antérieures à 1951, les données ne concernent que les nationaux finlandais se trouvant en Finlande, mais pour 1950 le taux est calculé sur la base d'un chiffre de population comprenant les résidents étrangers; à partir de 1951, y compris les nationaux finlandais se trouvant temporairement hors de Finlande.

14. Deaths and crude death rates (continued)

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[5] Four-year average.
[6] Two-year average.
[10] Three-year average.
[18] For 1959.
[41] For 1949.
[68] Prior to 1956, data tabulated by year of registration rather than occurrence.
[72] Prior to 1951, data tabulated by year of registration rather than occurrence.
[103] Rates computed on population excluding armed forces.
[144] Beginning 1946, data include deaths among alien armed forces stationed in the area and among national armed forces wherever stationed, but rates are computed on population excluding alien armed forces and members of career military service outside country, unless on duty in Germany or Austria.
[145] For 1945, excludes data for Departments of Bas-Rhin, Haut-Rhin and Moselle, and also for armed forces.
[146] Note suppressed.
[147] Including residents of the Federal Republic of Germany temporarily in West Berlin, and excluding alien armed forces and non-resident civilians temporarily in the area.
[148] For 1946-1947, excludes deaths of aliens in the former Saar.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[5] Moyenne pour quatre ans.
[6] Moyenne pour deux ans.
[10] Moyenne pour trois ans.
[18] 1959.
[41] 1949.
[68] Pour les années antérieures à 1956, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[72] Pour les années antérieures à 1951, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[103] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires.
[144] A partir de 1946, y compris les décès de militaires étrangers en garnison sur le territoire et de militaires français où qu'ils soient en garnison; cependant, les militaires étrangers dans le pays et les militaires français de carrière en garnison hors du pays à l'exception de ceux qui font partie des forces d'occupation en Allemagne et en Autriche, ne sont pas compris, pour le calcul des taux, dans le chiffre de population auquel est rapporté le nombre des décès.
[145] 1945 : Non compris les départements du Bas-Rhin, du Rhin et de la Moselle et compte non tenu des militaires.
[146] Note supprimée.
[147] Y compris les résidents de la République fédérale d'Allemagne se trouvant temporairement dans Berlin-Ouest mais non compris les membres des familles des militaires étrangers et des civils non résidents se trouvant temporairement sur le territoire.
[148] 1946-1947 : non compris les décès des étrangers se trouvant sur l'ancien territoire de la Sarre.

14. Décès et taux bruts de mortalité (suite)

[Voir note au début du tableau.]

[149] Including residents of West Berlin temporarily in the Federal Republic of Germany and excluding alien armed forces and non-resident civilians temporarily in the area.

[150] Rates computed on population including armed forces stationed outside country and excluding alien armed forces stationed in the area.

[151] Data are deaths registered within one year of occurrence.

[152] Prior to 1951, rates computed on population including armed forces and civilians stationed outside country.

[153] Data include deaths of armed forces stationed outside country and exclude those among non-Maltese armed forces in the area, but rates computed on population excluding non-Maltese armed forces stationed in the area and, beginning 1957, including civilian nationals temporarily outside country.

[154] Excluding alien armed forces stationed in the area.

[155] Including residents outside country if listed in a Netherlands population register, but for 1945 excluding deaths of deportees in Germany. Prior to 1959, excluding Amboynese living in camps.

[156] Including residents temporarily outside country.

[157] Data tabulated by year of occurrence for England and Wales (except for 1949) and by year of registration for Northern Ireland and Scotland.

[158] Computed on population including armed forces outside country and merchant seamen at sea but excluding Commonwealth and foreign armed forces within country.

[159] Computed on population including merchant seamen at sea for England and Wales in 1950.

[160] For 1949, data tabulated by year of registration rather than occurrence.

[161] Computed on population including, in 1950, merchant seamen at sea.

[149] Y compris les résidents de Berlin-Ouest se trouvant temporairement dans la République fédérale d'Allemagne, mais non compris les membres des familles des militaires étrangers et des civils non résidents se trouvant temporairement dans Berlin-Ouest.

[150] Taux calculés sur la base d'un chiffre de population qui comprend les militaires nationaux hors du pays, mais non les militaires étrangers en garnison sur le territoire.

[151] Décès enregistrés de l'année qui suit l'événement.

[152] Pour les années antérieures à 1951, taux calculés sur la base d'un chiffre de population qui comprend les militaires et les civils nationaux en poste hors du territoire.

[153] Y compris les décès de militaires nationaux hors du territoire, mais non compris les décès des militaires non maltais en garnison sur le territoire. Cependant, les taux sont calculés sur la base d'un chiffre de population qui ne comprend pas les militaires non maltais en garnison sur le territoire mais qui, à partir de 1957, comprend les civils nationaux temporairement hors du pays.

[154] Non compris les décès de militaires étrangers en garnison sur le territoire.

[155] Y compris les décès de résidents survenus hors du territoire, à condition qu'ils aient été inscrits sur un registre de population néerlandais, mais pour 1945 non compris ceux des déportés en Allemagne. Pour les années antérieures à 1959, non compris les Amboynais vivant dans des camps.

[156] Y compris les décès de résidents se trouvant temporairement hors du pays.

[157] Les données sont exploitées selon l'année de l'événement pour l'Angleterre et le Pays de Galles (sauf pour 1949) et selon l'année de l'enregistrement pour l'Irlande du Nord et l'Ecosse.

[158] Calcul effectué sur la base d'un chiffre de population qui comprend les équipages de la marine marchande en mer mais non les militaires du Commonwealth ni les militaires étrangers dans le pays.

[159] Calcul effectué sur la base d'un chiffre de population qui, pour l'Angleterre et le Pays de Galles, en 1950, comprend les équipages de la marine marchande en mer.

[160] Pour 1949, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[161] Calcul effectué sur la base d'un chiffre de population qui, en 1950, comprend les équipages de la marine marchande en mer.

14. Deaths and crude death rates (continued)

[See note at head of table.]

[165] Corresponding rates computed on population excluding United States military personnel, their dependants and contract employees for 1947 and 1949 (average), 1950-54, 1955-59 and 1952-1960 are 10.7, 5.9, 4.9, 5.9, 7.8, 5.6, 5.5, 4.3, 5.1, 4.6, 5.8 and *6.1, respectively.

[166] Deaths are for years ended 30 June but rates computed on population for years ended 31 December of the previous year.

[166a] For European and assimilated population.

[167] Excluding United States military personnel, their dependants and contract employees. For 1950-1952, excluding Rota. For 1954, excluding Rota and outlying islands of the Yap district.

[168] Beginning 1953, data are for Tongan population only.

[169] Prior to 1951, rates based on deaths for years ended 31 March and computed on population for years ended 30 September of previous year. For 1951, data are for Samoan population only and, prior to 1954, include late foetal deaths among Samoan population.

[170] Death registration estimated to be 80 per cent complete in 1956.

[165] Taux correspondants calculés sur la base d'un chiffre de population qui ne comprend pas les militaires des Etats-Unis et les membres de leur famille les accompagnant, ni les agents contractuels des Etats-Unis, pour 1947 et 1949 (moyenne), 1950-54, 1955-59 et chacune des années de la période 1952-1960 s'établissent respectivement comme suit : 10,7; 5,9; 4,9; 5,9; 7,8; 5,6; 5,5; 4,3; 5,1; 4,6; 5,8; et *6,1.

[166] Les données se rapportent à des périodes annuelles se terminant le 30 juin mais les taux sont calculés sur la base d'un chiffre de population qui se rapporte à des périodes annuelles se terminant le 31 décembre de l'année précédente.

[166a] Population européenne et assimilée.

[167] Non compris les militaires des Etats-Unis et les membres de leur famille les accompagnant, ni les agents contractuels des Etats-Unis. 1950-1952 : non compris Rota. 1954 : non compris Rota, ni les îles périphériques du district de Yap.

[168] A partir de 1953, Tongans seulement.

[169] Pour les années antérieures à 1951, taux calculés sur la base d'un chiffre de décès qui se rapporte à des périodes annuelles se terminant le 31 mars et d'un chiffre de population qui se rapporte à des périodes annuelles se terminant le 30 septembre de l'année précédente. 1951 : Samoans seulement. Pour les années antérieures à 1954, y compris les morts foetales tardives survenues parmi les Samoans.

[170] 1956 ; l'enregistrement saisirait environ 80 pour 100 des décès.

15. Deaths by age and sex : 1955–1960

[Date exclude foetal deaths. "Month" as used in footnotes refers to the calendar, rather than lunar, period. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 33.]

Italics: Data are unreliable or of unknown completeness.
[1] Including the two Departments of the Sahara.
[2] Data exclude live-born infants dying before registration of birth.
[3] For 1955 and 1957-1959, excluding armed forces.
[4] Includes infant deaths of unknown age for 1955-1959 as follows: 4, 9, 15, 10 and 2, respectively.
[5] For under 5 days.
[6] For 5-9 days.
[7] For 10-29 days.
[8] For 30-364 days.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
[1] Y compris les deux départements du Sahara.
[2] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[3] 1955 et 1957-1959 : non compris les forces armées.
[4] Y compris les décès d'enfants (de moins de 1 an) d'âge exact inconnu dont le nombre pour les années 1955-1959 s'établit à 4, 9, 15, 10 et 2 respectivement.
[5] Moins de 5 jours.
[6] 5-9 jours.
[7] 10-29 jours.
[8] 30-364 jours.

15. Décès selon l'âge et le sexe : 1955–1960

[Les données ne comprennent pas les morts fœtales. Le terme "mois", dans les notes, désigne le mois civil et non le mois lunaire. Les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et les insuffisances des données, voir Notes Techniques, page 85.]

[9] Includes infant deaths of unknown age for 1955-1958 as follows: 6, 12, 12 and 15, respectively.
[10] Excluding data for the two Departments of the Sahara.
[11] Population which has fulfilled certain conditions established by law, i.e., achieved a prescribed degree of material and social development as measured by educational level, language used and mode of living.
[12] For 7-30 days.
[13] For 31-364 days.
[14] African population not having fulfilled certain conditions established by law (cf. [11]) are deemed to be living according to tribal customs.
[15] For under 6 years.
[16] For 6-19 years.

[9] Y compris les décès d'enfants (de moins de 1 an) d'âge exact inconnu dont le nombre pour les années 1955-1958 s'établit à 6, 12, 12 et 15 respectivement.
[10] Non compris les deux départements du Sahara.
[11] Population remplissant certaines conditions fixées par la loi, c'est-à-dire ayant atteint un degré de développement matériel et social déterminé du point de vue du niveau d'instruction, de la langue parlée et du mode de vie.
[12] 7-30 jours.
[13] 31-364 jours.
[14] La population africaine, qui ne remplit pas certaines conditions fixées par la loi (voir note [11]), est censée vivre selon des coutumes tribales.
[15] Moins de 6 ans.
[16] 6-19 ans.

15. Deaths by age and sex (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
[17] Infant deaths by age and sex not available; total for both sexes is 913.
[18] Data include late foetal deaths.
[19] For 1-2 years.
[20] For 3-6 years.
[21] For 7-19 years.
[22] For 7-14 years.
[23] For 15-17 years.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[17] La répartition des décès d'enfants de moins d'un an selon l'âge et le sexe n'est pas connue; le nombre total des décès pour l'ensemble des deux sexes est de 913.
[18] Y compris les morts fœtales tardives.
[19] 1-2 ans.
[20] 3-6 ans.
[21] 7-19 ans.
[22] 7-14 ans.
[23] 15-17 ans.

[24] For 18-24 years.
[25] Includes 2 infant deaths of unknown age.
[26] Includes 1 infant death of unknown age.
[27] Data are for a compulsory registration area of 36 towns and townships which comprises about 12 per cent of total population and is not representative of Ghana.
[28] Reason for discrepancy between sum of frequencies for male and female shown here and deaths for both sexes shown elsewhere not ascertained.
[29] Includes infant deaths of unknown age numbering, for male, 1 531 in 1958 and 1 354 in 1959; for female, 1 475 in 1958 and 1 372 in 1959.

[24] 18-24 ans.
[25] Y compris 2 décès d'enfants (de moins de 1 an) d'âge exact inconnu.
[26] Y compris 1 décès d'enfant (de moins de 1 an) d'âge exact inconnu.
[27] Données se rapportant à une zone où l'enregistrement est obligatoire; cette zone se compose de 36 villes et municipalités comptant 12 pour 100 environ de la population totale et n'est pas représentative de l'ensemble du Ghana.
[28] On ne sait pas comment s'explique la divergence entre la somme des données pour l'un et l'autre sexe présentées ici et le total pour les deux sexes indiqué ailleurs.
[29] Y compris les décès d'enfants (de moins de 1 an) d'âge exact inconnu, soit pour le sexe masculin 1 531 en 1958 et 1 354 en 1959 et pour le sexe féminin 1 475 en 1958 et 1 372 en 1959.

[32] Summation of frequencies for infant age groups gives total of 963 for male and 797 for female; reason for discrepancy not ascertained.
[33] For under 3 months.
[34] For 3 months to 364 days.
[35] Northern part of former Spanish Protectorate.
[36] Data exclude live-born infants dying within 24 hours of birth.
[37] The former French Protectorate.
[38] Includes infant deaths of unknown age, numbering 5 for male and 3 for female.
[39] For under 10 days.
[40] For 10-30 days.

[32] La somme des données pour les différents groupes d'âges concernant la mortalité infantile s'établit à 963 pour le sexe masculin et 797 pour le sexe féminin; on ne sait pas comment s'explique la divergence.
[33] Moins de 3 mois.
[34] 3 mois-364 jours.
[35] Partie nord de l'ancien Protectorat espagnol.
[36] Non compris les enfants décédés dans les 24 heures qui ont suivi la naissance.
[37] Ancien Protectorat français.
[38] Y compris les décès d'enfants (de moins de 1 an) d'âge exact inconnu, soit 5 pour le sexe masculin et 3 pour le sexe féminin.
[39] Moins de 10 jours.
[40] 10-30 jours.

Italics: Data are unreliable or of unknown completeness.

[2] Data exclude live-born infants dying before registration of birth.

[11] Population which has fulfilled certain conditions established by law, i.e., achieved a prescribed degree of material and social development as measured by educational level, language used and mode of living.

[12] For 7-30 days.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.

[2] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.

[11] Population remplissant certaines conditions fixées par la loi, c'est-à-dire ayant atteint un degré de développement matériel et social déterminé du point de vue du niveau d'instruction, de la langue parlée et du mode de vie.

[12] 7-30 jours.

15. Décès selon l'âge et le sexe (suite)

39	58	45	63	47	68	73	90	115	128	94	72	86	2	40

[41] Summation of frequencies for age groups gives total of 471 for male and 228 for female; reason for discrepancy not ascertained.
[42] For 5-16 years.
[43] For 17 years and over.
[44] Includes infant deaths of unknown age numbering, for male, 33 in 1955 and 42 in 1958; for female, 20 in 1955 and 29 in 1958.

[41] La somme des données pour les différents groupes d'âge s'établit à 471 pour le sexe masculin et à 228 pour le sexe féminin; on ne sait pas comment s'explique la divergence.
[42] 5-16 ans.
[43] 17 ans et plus.
[44] Y compris les décès d'enfants (de moins de 1 an) d'âge exact inconnu, soit pour le sexe masculin 33 en 1955 et 42 en 1958 et pour le sexe féminin 20 en 1955 et 29 en 1958.

Italics: Data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
[36] Data exclude live-born infants dying within 24 hours of birth.
[47] Prior to 31 May 1961, known as Union of South Africa.
[48] For 7 days to under 1 month.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[36] Non compris les enfants décédés dans les 24 heures qui ont suivi la naissance.
[47] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.
[48] 7 jours-moins de 1 mois.

[49] For 1 month to 364 days.

[50] Includes infant deaths of unknown age, numbering 4 for male and 3 for female.

[51] Infant deaths by age and sex not available. Distribution for both sexes by age groups is as follows: under 6 days, 63; 7-27 days, 67; 28-364 days, 167.

[49] 1 mois-364 jours.

[50] Y compris les décès d'enfants (de moins de 1 an) d'âge exact inconnu, soit 4 pour le sexe masculin et 3 pour le sexe féminin.

[51] La répartition des décès d'enfants de moins de 1 an selon l'âge et le sexe n'est pas connue; pour l'ensemble des deux sexes, elle s'établit comme suit : moins de 6 jours, 63; 7-27 jours, 67; 28-364 jours, 167.

Italics: Data are unreliable or of unknown completeness.

† Data tabulated by year of registration rather than occurrence.

[49] For 1 month to 364 days.

[52] Infant deaths by age and sex not available. Distribution for both sexes by age groups under 1 day, 1 day to under 1 month and 1 month to 364 days is as follows: for 1957, 9, 20 and 38, respectively; for 1958, 17, 18 and 27; for 1959, 8, 24 and 39; for 1960, 6, 10 and 36.

[53] European and coloured populations only.

[54] Excluding Algerian refugees temporarily in the country, estimated at about 180 000 in 1959.

[55] Includes infant deaths of unknown age, numbering 5 for male and 6 for female.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[49] 1 mois-364 jours.

[52] La répartition des décès d'enfants de moins de 1 an selon l'âge et le sexe n'est pas connue. Pour l'ensemble des deux sexes, elle s'établit comme suit sur la base des groupes d'âge moins de 1 jour, 1 jour-moins de 1 mois et 1 mois-364 jours : 9, 20 et 38 pour 1957; 17, 18 et 27 pour 1958; 8, 24 et 39 pour 1959; 6, 10 et 36 pour 1960.

[53] Population européenne et population de couleur seulement.

[54] Non compris les réfugiés algériens temporairement dans le pays, au nombre de 180 000 environ en 1959 (estimation).

[55] Y compris les décès d'enfants (de moins de 1 an) d'âge exact inconnu, soit 5 pour le sexe masculin et 6 pour le sexe féminin.

15. Décès selon l'âge et le sexe (suite)

[56] For 1-9 days.
[57] For 10 days to under 1 month.
[58] Between 21 February 1958 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only. The former Syrian Region, which seceded on that date, appears as "Syria" under Asia. Data are for the former Egyptian Region.
[59] Summation of frequencies for infant age groups gives total of 61 321 for male and 57 842 for female; reason for discrepancy not ascertained.
[60] For localities having Health Bureaux, which comprised 43.7 per cent of total population in 1958.

[56] 1-9 jours.
[57] 10 jours-moins de 1 mois.
[58] 21 février 1958-29 septembre 1961 : Région égyptienne et Région syrienne; à partir du 29 septembre 1961, ancienne Région égyptienne seulement; l'ancienne Région syrienne ayant fait sécession à cette date, les données pertinentes figurent en regard de la rubrique "Syrie", sous la rubrique générale "Asie". Les données se rapportent à l'ancienne Région égyptienne.
[59] La somme des données pour les différents groupes d'âge concernant la mortalité infantile s'établit à 61 321 pour le sexe masculin et 57 842 pour le sexe féminin; on ne sait pas comment s'explique la divergence.
[60] Données concernant les localités dotées d'un bureau d'hygiène, qui comprenaient 43,7 pour 100 de la population totale en 1958.

[60] For localities having Health Bureaux, which comprised 43.7 per cent of total population in 1958.

[61] Includes infant deaths of unknown age for 1957-1960 as follows: male, 9, 6, 10 and 1, respectively; female, 4, 10, 5 and 2.

[62] Excluding tourists and, beginning 1956, United Kingdom and United States armed forces and their dependants stationed in the area.

[63] For 1-5 years, 6-10, 11-15, 16-25, 26-35, 36-45, 46-55, 56-65, 66-75, 76-85, and 86 years and over, as appropriate.

[64] Summation of frequencies for age groups gives total for male of 169 in 1956 and 204 in 1959; for female of 163 in 1956, 157 in 1958 and 173 in 1959. Reason for discrepancy not ascertained.

[60] Données concernant les localités dotées d'un bureau d'hygiène, qui comprenaient 43,7 pour 100 de la population totale en 1958.

[61] Y compris les décès d'enfants (de moins de 1 an) d'âge exact inconnu dont le nombre pour les années 1957-1960 s'établissait comme suit : sexe masculin, 9, 6, 10 et 1 respectivement; sexe féminin, 4, 10, 5 et 2.

[62] Non compris les décès survenus parmi les touristes ni parmi les militaires du Royaume-Uni et des Etats-Unis en garnison sur le territoire et les membres de leur famille les accompagnant.

[63] Classement par âge adopté ici : 1-5 ans, 6-10, 11-15, 16-25, 26-35, 36-45, 46-55, 56-65, 66-75, 76-85 et 86 et plus.

[64] La somme des données pour les différents groupes d'âges s'établit à 169 en 1956 et 204 en 1959 pour le sexe masculin et 163 en 1956, 157 en 1958 et 173 en 1959 pour le sexe féminin. On ne sait pas comment s'explique la divergence.

Italics: Data are unreliable or of unknown completeness.

† Data tabulated by year of registration rather than occurrence.

[48] For 7 days to under 1 month. [49] For 1 month to 364 days.

[66] Includes deaths of residents outside country for 1957 and 1958 numbering, for male, 10 in 1957 and 17 in 1958; for female, 10 in 1957 and 6 in 1958.

[67] Includes infant deaths of unknown age, numbering 416 for male and 353 for female.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[48] 7 jours-moins de 1 mois. [49] 1 mois-364 jours.

[66] Y compris les décès de résidents hors du pays en 1957 et 1958 soit 10 et 17 respectivement pour le sexe masculin et 10 et 6 pour le sexe féminin.

[67] Y compris les décès d'enfants (de moins de 1 an) d'âge exact inconnu, soit 416 pour le sexe masculin et 353 pour le sexe féminin.

15. Décès selon l'âge et le sexe (suite)

[68] Data exclude deaths of infants dying before registration of birth (which are registered as "stillbirths" although they are known to have breathed) numbering, for 1955-1957 and 1959, 59, 58, 57 and 68, respectively, for both sexes. Also excluded are an additional number of "stillbirths" whose ability to breathe was not reported, numbering, for the same period, 193, 160, 64 and 74 for both sexes.

[69] For under 1 month.

[68] Compte non tenu des décès d'enfants de moins de 1 an survenus avant l'enregistrement de la naissance (ces enfants sont classés parmi les "mort-nés" bien que l'on sache qu'ils ont respiré), dont le nombre pour les années 1955-1957 et 1959 s'établit comme suit : 59, 58, 57 et 68 respectivement pour l'ensemble des deux sexes.

[69] Moins de 1 mois.

Italics: Data are unreliable or of unknown completeness.

† Data tabulated by year of registration rather than occurrence.

[48] For 7 days to under 1 month.

[49] For 1 month to 364 days.

[69] For under 1 month.

[70] Data exclude deaths of infants dying before registration of birth (which are registered as "stillbirths" although they are known to have breathed) numbering, for 1955-1957 and 1959, 74, 55, 60 and 56, respectively, for both sexes. Also excluded are an additional number of "stillbirths" whose ability to breathe was not reported, numbering, for the same period, 104, 89, 154 and 98 for both sexes.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[48] 7 jours-moins de 1 mois.

[49] 1 mois-364 jours.

[69] Moins de 1 mois.

[70] Compte non tenu des décès d'enfants de moins de 1 an survenus avant l'enregistrement de la naissance (ces enfants sont classés parmi les "mort-nés" bien que l'on sache qu'ils ont respiré), dont le nombre pour les années 1955-1957 et 1959 s'établit comme suit : 74, 55, 70 et 76 respectivement pour l'ensemble des deux sexes. Compte non tenu également du nombre supplémentaire des "mort-nés" dont on ignore s'ils ont pu respirer et dont le nombre pour les mêmes années s'établit comme suit : 104, 89, 154 et 98 pour l'ensemble des deux sexes.

[71] Beginning 1958, including residents outside the country if listed in Netherlands Antilles population register. Except for Curaçao since 1957, data exclude live-born infants dying before registration of birth. For 1955-1958 and 1960, data are for Aruba, Bonaire and Curaçao only, for 1959, for Aruba and Curaçao only.

[71] A partir de 1958, y compris les décès de résidents néerlandais se trouvant hors du pays s'ils sont inscrits sur un registre de population des Antilles néerlandaises. Non compris les décès d'enfants de moins de 1 an survenus avant l'enregistrement de la naissance, excepté pour Curaçao depuis 1957. 1955-1958 et 1960 : Aruba, Bonaire et Curaçao seulement; 1959, Aruba et Curaçao seulement.

[73] Excluding data for Canal Zone, shown separately above, and tribal Indian population, numbering 48 654 in 1950 and *60 540 in 1960.
[74] Prior to 1959, excluding Alaska and prior to 1960, excluding Hawaii.
[75] Data are based on a 10 per cent sample of death certificates.

[73] Non compris la zone du Canal, qui fait l'objet d'une rubrique distincte (voir plus haut), ni les Indiens vivant en tribus, au nombre de 48 654 en 1950 et *60 540 en 1960.
[74] Pour les années antérieures à 1959, non compris l'Alaska et, pour les années antérieures à 1960, non compris Hawaii.
[75] D'après un échantillon de 10 pour 100 des certificats de décès aux Etats-Unis.

Italics: Data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
[2] Data exclude live-born infants dying before registration of birth.
[8] For 30-364 days.
[26] Includes 1 infant death of unknown age.
[83] Data are burial permits.
[84] For 7-29 days.
[85] Excluding Indian jungle population.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[2] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[8] 30-364 jours.
[26] Y compris 1 décès d'enfant (de moins de 1 an) d'âge exact inconnu.
[83] D'après les permis d'inhumer délivrés.
[84] 7-29 jours.
[85] Non compris les Indiens de la jungle.

[86] Infant deaths by detailed age classification and sex not available. Distribution for both sexes by age groups under 1 day, 1-6 days and 7-27 days is as follows: for 1955, 1 025, 2 137 and 3 343, respectively; for 1956, 992, 2 077 and 3 228; for 1958, 795, 2 175 and 3 840.

[87] Infant deaths by age and sex not available. Distribution for both sexes by age groups under 1 day, 1-6 days, 7-27 days and 28-364 days is as follows: for 1957, 1 096, 2 102, 3 769 and 12 633 respectively; for 1959, 681, 2 137, 3 707 and 14 153.

[86] La répartition des décès d'enfants de moins de 1 an par groupes d'âge détaillés et par sexe n'est pas connue. Pour l'ensemble des deux sexes, elle s'établit comme suit sur la base des groupes d'âge, moins de 1 jour, 1-6 jours et 7-27 jours : 1 025, 2 137 et 3 343 respectivement pour 1955; 992, 2 077 et 3 228 pour 1956; 795, 2 175 et 3 840 pour 1958.

[87] La répartition des décès d'enfants de moins de 1 an selon l'âge et le sexe n'est pas connue. Pour l'ensemble des deux sexes de moins de 1 jour, 1-6 jours, 7-27 jours et 28-364 jours elle s'établit comme suit : pour 1957, 1 096, 2 102, 3 769 et 12 633 respectivement; pour 1959, 681, 2 137, 3 707 et 14 153.

[88] Data are for an area covered by 44 Health Units and 76 Health "Posts", which is not representative of Paraguay and for which population is not available.

[89] Excluding Indian jungle population, estimated at 350 000 in 1940.

[90] Excluding Negro and Indian population living in tribes, estimated at 26 000 in 1955-1957.

[91] Data exclude 13 deaths of unknown sex, of which 10 are known to be under one day of age and 1 under one year.

[92] Excluding Indian jungle population, numbering 56 705 in 1950 and estimated at 31 800 in 1961.

[88] Les données se rapportent à une région desservie par 44 centres sanitaires et 74 postes sanitaires; cette région n'est pas représentative du Paraguay et l'effectif de sa population n'est pas connu.

[89] Non compris les Indiens de la jungle au nombre de 350 000 en 1940 (estimation).

[90] Non compris les noirs et les Indiens vivant en tribus, au nombre de 26 000 en 1955-1957 (estimation).

[91] Non compris 13 décès de sexe inconnu dont 10 de moins de 1 jour et 1 de moins de 1 an.

[92] Non compris les Indiens de la jungle, au nombre de 56 705 en 1950 et estimés à 31 800 en 1961.

[95] Summation of frequencies for infant age groups gives total of 352 for male and 331 for female; reason for discrepancy not ascertained.
[96] For under 29 days.
[96a] For 29 days to under 1 year.
[97] Data are for a changing number of towns having a population of approximately 2 million.
[98] Data exclude 1 994 deaths of unknown age and sex in 1958 and 2 004 in 1959.
[99] Includes infant deaths of unknown age, numbering for male 1 004 and for female 832.
[100] Data are for year ended April 1959 and are estimates based on results of 1958-1959 demographic sample survey in 345 villages.

[95] La somme des données pour les différents groupes d'âge concernant la mortalité infantile s'établit à 352 pour le sexe masculin et 331 pour le sexe féminin; on ne sait pas comment s'explique la divergence.
[96] Moins de 29 jours.
[96a] 29 jours à moins de 1 an.
[97] Les données se rapportent à un nombre variable de villes qui comptent actuellement 2 millions d'habitants environ.
[98] Non compris 1 994 décès d'âge et sexe inconnus en 1958 et 2 004 en 1959.
[99] Y compris les décès d'enfants (de moins de 1 an) d'âge exact inconnu soit, 1 004 pour le sexe masculin et 832 pour le sexe féminin.
[100] Données pour la période annuelle se terminant en avril 1959; estimations établies d'après les résultats d'une enquête démographique par sondage effectuée en 1958-1959 dans 345 villages.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[2] Data exclude live-born infants dying before registration of birth.
[48] For 7 days to under 1 month.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[2] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[48] 7 jours-moins de 1 mois.

15. Décès selon l'âge et le sexe (suite)

[Voir note au début du tableau.]

Italics: Data are unreliable or of unknown completeness.

* Provisional.

† Data tabulated by year of registration rather than occurrence.

[103] Data exclude deaths of unknown sex as follows: for 1955, 11, of which 3 age 28-364 days and 2 age 1-4 years; for 1956, 9, of which 1 age under one day, 1 age 1-4 years and 1 age 25-29 years; for 1957, 8, of which 1 age under one day; for 1958, 11, of which 1 age under one day, 1 age 28-364 days and 1 age 1-4 years; for 1959, 8, of which 1 age under one day, 1 age 28-364 days and 2 age 1-4 years; for 1960, 1.

[104] Data are for a changing group of states and territories of the Registration Area. Reason for slight discrepancies between sum of frequencies for male and female shown here and deaths for both sexes shown elsewhere is variation in geographic coverage.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[103] Non compris les décès de sexe inconnu, soit pour 1955 : 11 décès dont 3 du groupe d'âge 28-364 jours et 2 du groupe d'âge 1-4 ans; pour 1956 : 9 dont 1 de moins de 1 jour, 1 du groupe d'âge 1-4 ans et 1 du groupe d'âge 25-29 ans; pour 1957 : 8, dont 1 de moins de 1 jour; pour 1958 : 11 dont 1 de moins de 1 jour, 1 du groupe d'âge 28-364 jours et 1 du groupe d'âge 1-4 ans; pour 1959 : 8 dont 1 de moins de 1 jour, 1 du groupe d'âge 28-364 jours et 2 du groupe d'âge 1-4 ans; pour 1960 : 1 d'âge inconnu.

[104] Les données se rapportent à un groupe variable d'Etats et de territoires de la zone d'enregistrement. Le léger écart existant entre la somme des données pour l'un et l'autre sexe présentées ici et le total pour les deux sexes indiqué ailleurs est dû à une modification de la portée géographique.

15. Décès selon l'âge et le sexe (suite)

[105] For 15-20 years, 21-30, 31-40, 41-50, 51-60 and 61 years and over, as appropriate.
[106] Data exclude 41 102 deaths of unknown age and sex.
[107] Excluding Bedouin population in the Negev.
[108] Includes infant deaths of unknown age for 1955-1960 as follows: male, 51, 54, 62, 44, 16 and 19, respectively; female, 60, 57, 69, 32, 22 and 21.
[109] Summation of frequencies for age groups gives total for male of 6 364 in 1956 and 6 184 in 1958, for female of 5 659 in 1956 and 5 509 in 1958; reason for discrepancy not ascertained.

[105] Classement par âge adopté ici : 15-20 ans, 21-30, 31-40, 41-50, 51-60, et 61 et plus.
[106] Non compris 41 102 décès d'âge et sexe inconnus.
[107] Non compris les Bédouins du Négeb.
[108] Y compris les décès d'enfants (de moins de 1 an) d'âge exact inconnu, qui pour les années 1955-1960 s'établissent comme suit : 51, 54, 62, 44, 16 et 19, respectivement pour le sexe masculin et 60, 57, 69, 32, 22 et 21, pour le sexe féminin.
[109] La somme des données pour les différents groupes d'âge s'établit à 6 364 en 1956 et 6 184 en 1958 pour le sexe masculin et 5 659 en 1956 et 5 509 en 1958 pour le sexe féminin; on ne sait pas comment s'explique la divergence.

[114] Excluding foreigners but including registered Palestinian refugees; for number of refugees, see Table 4.

[115] Infant deaths by age and sex not available. Distribution for both sexes by age groups is as follows: under 1 month, 935; 1 month to 364 days, 3 263.

[116] Excluding non-resident foreigners and registered Palestinian refugees. For number of refugees, see Table 4.

[117] Data are deaths recorded by Health Service only.

[118] Includes infant deaths of unknown age numbering, for male, 22 in 1959 and 3 in 1960; for female, 12 in 1959.

[114] Non compris les étrangers, mais y compris les réfugiés de Palestine immatriculés; pour leur nombre, voir le tableau 4.

[115] La répartition des décès d'enfants de moins de 1 an selon l'âge et le sexe n'est pas connue. Pour l'ensemble des deux sexes, elle s'établit comme suit : moins de 1 mois, 935; 1 mois-364 jours, 3 263.

[116] Non compris les étrangers non-résidents et les réfugiés de Palestine immatriculés. Pour le nombre de réfugiés, voir le tableau 4.

[117] Les données se rapportent uniquement aux décès enregistrés par le Service de la santé.

[118] Y compris les décès d'enfants (de moins de 1 an) d'âge exact inconnu, soit 22 en 1959 et 3 en 1960 pour le sexe masculin et 12 en 1959 pour le sexe féminin.

15. Deaths by age and sex (continued)

[119] Data are incomplete returns; for 1956-1959, reports were received from 78, 81, 84 and 84 per cent of local civil registrars, respectively.

[119a] Excluding deaths in *concelho* of Nagar-Aveli (population 41 532 in 1950).

[120] Data exclude 2 deaths of unknown age and sex.

[121] Includes infant deaths of unknown age, numbering 63 for male and 8 for female.

[122] Excluding Allied military and civilian personnel and their dependants stationed in the area.

[119] Données incomplètes; en 1956-1959, des bulletins n'ont été reçus que de 78, 81, 84 et 84 pour cent respectivement des bureaux d'état-civil.

[119a] Non compris le *concelho* de Nagar-Aveli (population 41 532 en 1950).

[120] Non compris 2 décès d'âge et sexe inconnus.

[121] Y compris les décès d'enfants (de moins de 1 an) d'âge exact inconnu, soit 63 pour le sexe masculin et 8 pour le sexe féminin.

[122] Non compris les militaires et agents civils alliés en poste sur le territoire, ni les membres de leur famille les accompagnant.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[2] Data exclude live-born infants dying before registration of birth.
[123] Data exclude deaths of unknown sex as follows: for 1957, 4, of which 3 infant and 1 age unknown; for 1958, 7, of which 1 infant and 6 age unknown; for 1959, 1 infant; for 1960, 3 of which 2 infant and 1 age unknown, in addition to 76 deaths of non-locally domiciled military and civilian services personnel and their dependants, of which 42 were infant deaths.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[2] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance.
[123] Non compris les décès de sexe inconnu soit, pour 1957 : 4 dont 3 d'enfants de moins de 1 an et 1 d'âge inconnu; pour 1958 : 7 dont 1 de moins de 1 an et 6 d'âge inconnu; pour 1959 : 1 de moins de 1 an; pour 1960 : 3 dont 2 de moins de 1 an et 1 d'âge inconnu, plus 76 décès (dont 42 de moins de 1 an) survenus parmi les militaires et les agents civils non domiciliés dans le territoire, et les membres de leur famille les accompagnant.

15. Décès selon l'âge et le sexe (suite)

[124] Formerly Syrian Region of United Arab Republic, reverted to status of independent nation 29 September 1961. Excluding nomad population, estimated at 179 722 at the end of 1956, and Palestinian refugees, numbering 119 648 on 1 July 1959. Data are deaths reported by physicians of Ministry of Health, which comprise about 61 per cent of registered deaths.

[125] Includes infant deaths of unknown age for 1955, 1956, 1958 and 1959 as follows: male, 359, 592, 721 and 785, respectively; female, 281, 496, 630 and 640.

[126] For March to December only.

[127] Data are for provincial capitals and district centers.

[128] Includes infant deaths of unknown age numbering, for male, 218 in 1957 and 115 in 1959, for female, 208 in 1957 and 94 in 1959.

[124] Ancienne région syrienne de la République arabe unie, redevenue Etat indépendant le 29 septembre 1961. Non compris la population nomade, soit 179 722 personnes à la fin de 1956 (estimation), ni les réfugiés de Palestine, au nombre de 119 648 au 1er juillet 1959. Les données représentent le nombre des décès déclarés par les médecins du Ministère de la santé, soit environ 61 pour 100 des décès enregistrés.

[125] Y compris les décès d'enfants (de moins de 1 an) d'âge exact inconnu dont le nombre pour les années 1955, 1956, 1958 et 1959 s'établit comme suit : 359, 592, 721 et 785 respectivement pour le sexe masculin et 281, 496, 630 et 640 pour le sexe féminin.

[126] Mars-décembre seulement.

[127] Capitales de province et chefs-lieux de district.

[128] Y compris les décès d'enfants (de moins de 1 an) d'âge exact inconnu soit : 218 en 1957 et 115 en 1959 pour le sexe masculin et 208 en 1957 et 94 en 1959 pour le sexe féminin.

Italics: Data are unreliable or of unknown completeness.
[28] Note suppressed.
[48] For 7 days to under 1 month.
[49] For one month to 364 days.
[136] Data exclude infants born alive after less than 28 weeks' gestation, of less than 1 000 grammes in weight and 35 centimetres in length, who die within 24 hours of birth.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
[28] Note supprimée.
[48] 7 jours-moins de 1 mois.
[49] 1 mois-364 jours.
[136] Il n'est pas tenu compte des enfants nés vivants après moins de 28 semaines de gestation, pesant moins de 1 000 grammes, mesurant moins de 35 centimètres de décédés dans les 24 heures qui ont suivi la naissance.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
[26] Includes 1 infant death of unknown age.
[138] Including armed forces stationed outside country.
[140] Classification by age based on difference between day, month and year of birth and death for ages under 5 years, and between year of birth and year of death for ages 5 and over.
[140a] Data exclude live-born infants dying before registration of birth ("ayant respirés"), numbering by sex for 1955-1960 as follows: male, 2 194, 2 188, 2 249, 2 125, 2 050 and 2 023, respectively; female, 1 420, 1 621, 1 629, 1 530, 1 576 and 1 500.
[141] For 1-10 days.
[142] For 11-28 days.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
[26] Y compris 1 décès d'enfant (de moins de 1 an) d'âge exact inconnu.
[138] Y compris les décès survenus parmi les militaires hors du territoire.
[140] Le classement selon l'âge repose sur la différence entre la date exacte de la naissance et celle du décès (l'une et l'autre exprimées selon le jour, le mois et l'année) jusqu'à moins de 5 ans et entre l'année de la naissance et celle du décès pour 5 ans et plus.
[140a] Non compris les enfants nés vivants et décédés avant l'enregistrement de leur naissance ("ayant respirés) dont le nombre pour les annés 1955 1960 s'établit comme suit pour chaque sexe : 2 194, 2 188, 2 249, 2 125, 2 050 et 2 023, respectivement pour le sexe masculin et 1 420, 1 621, 1 629, 1 530, 1 576 et 1 500.
[141] 1-10 jours.
[142] 11-28 jours.

15. Décès selon l'âge et le sexe (suite)

[143] For 29-364 days.
[144] Data for East Berlin are included with those for Eastern Germany.
[145] For under 4 days.
[146] For 4-10 days.
[147] For 11-27 days.
[148] For 28-364 days.
[149] Including residents of the Federal Republic of Germany temporarily in West Berlin and excluding alien armed forces and non-resident civilians temporarily in the area.
[149a] For infant deaths, except for those under 1 day, classification by age based on difference between date of birth and date of death, rather than on completed days of life.
[150] For under 2 months.
[151] For 2 months to 364 days.
[152] Data for the Saar are for 7-29 and 30-364 days, as appropriate.

[143] 29-364 jours.
[144] Les données relatives à Berlin-Est sont comprises dans celles qui se rapportent à l'Allemagne de l'Est.
[145] Moins de 4 jours.
[146] 4-10 jours.
[147] 11-27 jours.
[148] 28-364 jours.
[149] Y compris les décès de résidents de la République fédérale d'Allemagne se trouvant temporairement à Berlin-Ouest, mais non compris les décès survenus dans les familles des militaires étrangers et des civils non résidents se trouvant temporairement sur le territoire.
[149a] Pour les décès d'enfants de moins de 1 an, non compris les décès d'enfants de moins de 1 jour, le classement selon l'âge repose sur la différence entre la date de la naissance et celle du décès et non sur l'âge en jours révolus.
[150] Moins de 2 mois.
[151] 2 mois-364 jours.
[152] Classement adopté pour la Sarre : 7-29 et 30-364 jours.

Italics: Data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
[141] For 1-10 days.
[142] For 11-28 days.
[143] For 29-364 days.
[144] Data for East Berlin are included with those for East Germany.
[147] For 11-27 days.
[148] For 28-364 days.
[153] For under 11 days.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[141] 1-10 jours.
[142] 11-28 jours.
[143] 29-364 jours.
[144] Les données relatives à Berlin-Est sont comprises dans celles qui se rapportent à l'Allemagne de l'Est.
[147] 11-27 jours.
[148] 28-364 jours.
[153] Moins de 11 jours.

[149a] For infant deaths, except for those under 1 day, classification by age based on difference between date of birth and date of death, rather than on completed days of life.

[154] Including residents of West Berlin temporarily in the Federal Republic of Germany, and excluding deaths among alien armed forces and non-resident civilians temporarily in the area.

[155] Excludes deaths among non-resident population, numbering 24 male and 15 female.

[149a] Pour les décès d'enfants de moins de 1 an, non compris les décès d'enfants de moins de 1 jour, le classement selon l'âge repose sur la différence entre la date de la naissance et celle du décès et non sur l'âge en jours révolus.

[154] Y compris les décès de résidents de Berlin-Ouest se trouvant temporairement dans la République fédérale d'Allemagne, mais non compris les décès survenus dans les familles des militaires étrangers et des civils non résidents se trouvant temporairement à Berlin-Ouest.

[155] Non compris les décès de non-résidents, soit 24 pour le sexe masculin et 15 pour le sexe féminin.

[84] For 7-29 days.
[158] Including armed forces stationed outside country and excluding non-Maltese armed forces in the area.

[84] 7-29 jours.
[158] Y compris les décès de militaires nationaux hors du territoire, mais non compris les décès des militaires non maltais en garnison sur le territoire.

15. Deaths by age and sex (continued)

[See note at head of table.]

[159] Including residents outside country if listed in a Netherlands population register but excluding alien armed forces stationed in the area. Prior to 1959, excluding Amboynese living in camps.

[160] For infant deaths, classification by age based on difference between date of birth and date of death, rather than on completed hours or days of life. This procedure tends to understate frequencies in age group under 1 day and to overstate those in age group 1 day to under 1 week.

[159] Y compris les décès de résidents survenus hors du territoire, à condition qu'ils aient été inscrits sur un registre de population néerlandais, mais non compris les décès de militaires étrangers en garnison sur le territoire. Pour les années antérieures à 1959, non compris les Amboynais vivant dans des camps.

[160] Pour les décès d'enfants de moins de 1 an, le classement par âge repose sur la différence entre la date du décès et celle de la naissance et non sur l'âge en heures ou jours révolus. Cette méthode tend à introduire une erreur par défaut dans les données relatives au groupe "moins de 1 jour" et par excès dans les données relatives au groupe "1 jour-moins de 1 semaine".

15. Décès selon l'âge et le sexe (suite)

[Voir note au début du tableau.]

[161] Including Norwegian residents temporarily outside country.

[162] Infant deaths by age and sex not available. Distribution for both sexes by age group is as follows: under 1 day, 5 897; 1-9 days, 10 147; 10-29 days, 8 916; 30-364 days, 39 646, and 28 of unknown age.

[163] Includes infant deaths of unknown age numbering, for male, 13 in 1957 and 4 in 1959; for female, 1 in 1956, 12 in 1957, 2 in 1958 and 3 in 1959.

[161] Y compris les décès de résidents norvégiens se trouvant temporairement hors du pays.

[162] La répartition des décès d'enfants de moins de 1 an selon l'âge et le sexe n'est pas connue. Pour l'ensemble des deux sexes, elle s'établit comme suit : moins de 1 jour, 5 897; 1-9 jours, 10 147; 10-29 jours, 8 916; 30-364 jours, 39 646, plus 28 décès d'âge inconnu.

[163] Y compris les décès d'enfants (de moins de 1 an) d'âge exact inconnu, soit 13 en 1957 et 4 en 1959 pour le sexe masculin et 1 en 1956, 12 en 1957, 2 en 1958 et 3 en 1959 pour le sexe féminin.

15. Deaths by age and sex (continued)

[164] Data are for age groups 7 days to under 2 months and 2 months to 364 days, as appropriate. Distribution available for both sexes only by age groups 7-29 days and 30-364 days is as follows: for 1957, 6 237 and 22 588, respectively; for 1958, 4 996 and 18 391.

[165] Infant deaths by age and sex not available. Distribution for both sexes by age groups 1 day to under 1 month and 1 month to 364 days is as follows: for 1957, 9 452 and 20 760, respectively; for 1958, 8 348 and 19 130.

[164] Classement par âge adopté ici : 7 jours-moins de 2 mois et 2 mois-364 jours. Pour l'ensemble des deux sexes, la répartition des décès s'établit comme suit sur la base des groupes d'âge 7-29 jours et 30-364 jours : pour 1957, 6 237 et 22 588 respectivement et pour 1958, 4 996 et 18 391.

[165] La répartition des décès d'enfants de moins de 1 an selon l'âge et le sexe n'est pas connue. Pour l'ensemble des deux sexes elle s'établit comme suit sur la base des groupes d'âge 1 jour-moins de 1 mois et 1 mois-364 jours : pour 1957, 9 452 et 20 760 respectivement; pour 1958, 8 348 et 19 130.

15. Deaths by age and sex (continued)

[168] Summation of frequencies for infant age groups gives total of 16; reason for discrepancy not ascertained.
[169] Excluding full-blooded aborigines, estimated at 39, 319 in June 1954.
[170] Prior to 1958, data are for years ended 31 March.

[168] La somme des données pour les différents groupes d'âge concernant la mortalité infantile s'établit à 16; on ne sait pas comment s'explique la divergence.
[169] Non compris les aborigènes purs, au nombre de 39 319 en juin 1954 (estimation).
[170] Pour les années antérieures à 1958, les données se rapportent à des périodes annuelles se terminant le 31 mars.

[175] Summation of frequencies for infant age groups gives total for male of 8 in 1955 and 6 in 1956, for female of 28 in 1955; reason for discrepancy not ascertained.

[175] La somme des données pour les différents groupes d'âge concernant la mortalité infantile s'établit à 8 en 1955 et 6 en 1956 pour le sexe masculin et à 28 en 1955 pour le sexe féminin; on ne sait pas comment s'explique la divergence.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[177] Data are for Tongan population only.
[178] Summation of frequencies gives total of 172 for male and 117 for female; reason for discrepancy not ascertained.
[179] Data include late foetal deaths among Samoan population.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[177] Tongans seulement.
[178] La somme des données s'établit à 172 pour le sexe masculin et 117 pour le sexe féminin; on ne sait pas comment s'explique la divergence.
[179] Y compris les morts fœtales tardives survenues parmi les Samoans.

15. Décès selon l'âge et le sexe (suite)

[Voir note au début du tableau.]

AGE (en années)														
25 – 29	30 – 34	35 – 39	40 – 44	45 – 49	50 – 54	55 – 59	60 – 64	65 – 69	70 – 74	75 – 79	80 – 84	85 plus	Unknown Inconnu

9	4	11	10	6	6	5	9	10	9	10	10	12	2	22

[180] Infant deaths by age and sex not available. Distribution for both sexes by age groups under 1 day, 1-6 days, 7-27 days and 28-364 days is as follows: for 1958, 3, 18, 7 and 96, respectively; for 1959, 11, 13, 7 and 59.

[180] La répartition des décès d'enfants de moins de 1 an selon l'âge et le sexe n'est pas connue. Pour l'ensemble des deux sexes, elle s'établit comme suit sur la base des groupes d'âge moins de 1 jour, 1-6 jours, 7-27 jours et 28-364 jours : pour 1958, 3, 18, 7 et 96 respectivement et pour 1959, 11, 13, 7 et 59.

16. Death rates specific for age and sex — Taux de mortalité selon l'âge et le sexe: 1952–1960

[Data exclude foetal deaths. Rates are the number of deaths in each age-sex group per 1 000 population of the same age and sex. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 34. For infant mortality rates by age, see Table 13. — Il n'est pas tenu compte des morts fœtales. Les taux représentent le nombre de décès des personnes d'âge et de sexe donnés pour 1 000 personnes du même âge et du même sexe. Les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et les insuffisances des données, voir Notes Techniques, page 86. Pour ce qui est des taux de mortalité infantile selon l'âge ,on se reportera au tableau 13.]

Italics: Data are unreliable or of unknown completeness.

† Rates known to refer to year of registration rather than occurrence.

[1] Including deaths at unknown age.

[2] Including the two Departments of the Sahara.

[3] Rates (for all ages and under one year) exclude deaths of infants dying before registration of birth.

[4] Rates based on total deaths but computed on population actually enumerated (unadjusted for under-enumeration) and excluding personnel in military establishments.

[5] Rates not computed by the Statistical Office of the United Nations; they are based on results of 1955 demographic sample survey of residents, but adjusted to take account of lack of strict correspondence between deaths reported and population base.

[6] Differs slightly from corresponding rate shown elsewhere because computed on population estimated as of 31 December rather than midyear.

[7] Differs slightly from corresponding rate shown elsewhere because computed on enumerated population rather than midyear estimate.

[8] Rates not computed by the Statistical Office of the United Nations.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.

† Statistiques établies selon l'année de l'enregistrement et non l'année de l'événement.

[1] Y compris les décès d'âge inconnu.

[2] Y compris les deux départements du Sahara.

[3] Les taux (tous âges et moins de 1 an) ne tiennent pas compte des décès d'enfants de moins de 1 an survenus avant l'enregistrement de leur naissance.

[4] Taux calculés en rapportant le nombre des décès à l'effectif de la population effectivement dénombrée (sans ajustement pour sous-dénombrement) non compris les personnes vivant dans des locaux de l'armée.

[5] Le calcul des taux n'a pas été fait au Bureau de statistique des Nations Unies; les taux ont été établis à partir des résultats de l'enquête démographique par sondage des résidents, effectuée en 1955, mais ils ont été ajustés pour tenir compte du défaut de correspondance entre le nombre des décès déclarés et l'effectif de la population auquel ce chiffre est rapporté.

[6] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base d'une estimation de la population au 31 décembre et non au milieu de l'année.

[7] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base de l'effectif de la population dénombrée et non de l'estimation au milieu de l'année.

[8] Le calcul des taux n'a pas été fait au Bureau de statistique des Nations Unies.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Rates known to refer to year of registration rather than occurrence.
[1] Including deaths at unknown age.
[7] Differs slightly from corresponding rate shown elsewhere because computed on enumerated population rather than midyear estimate.
[9] Prior to 31 May 1961, known as Union of South Africa.
[10] Computed on population aged 20-45 years and 46 years and over, as appropriate.
[10a] Including Canadian residents temporarily in the United States, but excluding US residents temporarily in Canada.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Statistiques établies selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[7] Ce taux diffère légerement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base de l'effectif de la population dénombrée et non de l'estimation au milieu de l'année.
[9] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.
[10] Classement par âge adopté ici : 20-45 ans et 46 ans et plus.
[10a] Y compris les décès de résidents canadiens se trouvant temporairement aux Etats-Unis, mais non compris les décès des résidents des Etats-Unis se trouvant temporairement au Canada.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Rates known to refer to year of registration rather than occurrence.
[1] Including deaths at unknown age.
[3] Rates (for all ages and under one year) exclude deaths of infants dying before registration of birth.
[7] Differs slightly from corresponding rate shown elsewhere because computed on enumerated population rather than midyear estimate.
[8] Rates not computed by the Statistical Office of the United Nations.
[11] Differs slightly from corresponding rate shown elsewhere because computed on population estimate which excludes migratory balance, not available by age and sex.
[11a] Data are for Aruba and Curaçao only. Including residents outside country if listed in a Netherlands Antilles population register. For Aruba, data exclude live-born infants dying before registration of birth.
[12] Excluding data for Canal Zone, shown separately above, and tribal Indian population, numbering *60 540 in 1960.

Italique : Données discutables ou dont le degré de complétude n'est pas connu. * Données provisoires.
† Statistiques établies selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[3] Les taux (tous âges et moins de 1 an) ne tiennent pas compte des décès d'enfants de moins de 1 an survenus avant l'enregistrement de leur naissance.
[7] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base de l'effectif de la population dénombrée et non de l'estimation au milieu de l'année.
[8] Le calcul des taux n'a pas été fait au Bureau de statistique des Nations Unies.
[11] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base d'une estimation de la population qui ne tient pas compte de la balance migratoire dont la structure par sexe et par âge n'est pas connue.
[11a] Aruba et Curaçao seulement. Y compris les décès de résidents néerlandais se trouvant hors du pays s'ils sont inscrits sur un registre de population des Antilles néerlandaises. Pour Aruba, non compris les décès d'enfants de moins de 1 an survenus avant l'enregistrement de la naissance.
[12] Non compris la Zone du Canal qui fait l'objet d'une rubrique distincte (voir plus haut), ni les Indiens vivant en tribus (au nombre de *60 540 en 1960).

16. Death rates specific for age and sex (continued) — Taux de mortalité selon l'âge et le sexe (suite)

* Provisional.
† Rates known to refer to year of registration rather than occurrence.
[1] Including deaths at unknown age.
[13] Rates include deaths among armed forces but are computed on civilian population.
[14] Prior to 1959, excluding Alaska and prior to 1960, excluding Hawaii.
[15] Age-specific rates based on a 10 per cent sample of death certificates.
[16] Differs slightly from corresponding rate shown elsewhere because computed on a mean of revised end-year population estimates.
[17] Differs slightly from corresponding rate shown elsewhere because computed on mean of end-year estimates rather than midyear.

* Données provisoires.
† Statistiques établies selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[13] Taux calculés en rapportant le nombre de décès, y compris ceux des militaires, à l'effectif de la population civile.
[14] Pour les années antérieures à 1959, non compris l'Alaska, et pour les années antérieures à 1960, non compris Hawaii.
[15] Taux selon l'âge calculés à partir d'un échantillon de 10 pour cent des certificats de décès aux Etats-Unis.
[16] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base d'une moyenne des estimations revisées de la population à la fin de l'année.
[17] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base d'une moyenne des estimations à la fin de l'année et non au milieu de l'année.

16. Death rates specific for age and sex (continued) — Taux de mortalité selon l'âge et le sexe (suite)

† Rates known to refer to year of registration rather than occurrence.
[1] Including deaths at unknown age.
[17] Differs slightly from corresponding rate shown elsewhere because computed on mean of end-year estimates rather than midyear.

† Statistiques établies selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[17] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base d'une moyenne des estimations à la fin de l'année et non au milieu de l'année.

16. Death rates specific for age and sex (continued) — Taux de mortalité selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

* Provisional.
† Rates known to refer to year of registration rather than occurrence.
[1] Including deaths at unknown age.
[6] Differs slightly from corresponding rate shown elsewhere because computed on population estimated as of 31 December rather than midyear.
[18] Excluding Amerindian population; for numbers of, see Table 4.
[19] Rates computed on population actually enumerated 25 April 1952, i.e., excluding 5.8 per cent adjustment for underenumeration.
[20] Excluding Indian jungle population, estimated at 350 000 in 1940.
[21] Differs from corresponding rate shown elsewhere because computed on enumerated population including adjustment for underenumeration estimated at 465 144 at 1940 census.
[22] Excluding Negro and Indian population living in tribes, estimated at 26 000 in 1955.

* Données provisoires.
† Statistiques établies selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[6] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base d'une estimation de la population au 31 décembre et non au milieu de l'année.
[18] Non compris les Amérindiens; pour leur nombre, voir le tableau 4.
[19] Taux calculés sur la base de la population effectivement dénombrée le 25 avril 1952, c'est-à-dire compte tenu d'un ajustement de 5,8 pour 100 pour sous-dénombrement.
[20] Non compris les Indiens de la jungle, au nombre de 350 000 en 1940 (estimation).
[21] Ce taux diffère du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base de la population dénombrée, y compris un ajustement pour sous-dénombrement (estimé à 465 144 unités lors du recensement de 1940).
[22] Non compris les noirs et les Indiens vivant en tribus, au nombre de 26 000 en 1955 (estimation).

16. Death rates specific for age and sex (continued) — Taux de mortalité selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

Italics: Data are unreliable or of unknown completeness.
† Rates known to refer to year of registration rather than occurrence.
[1] Including deaths at unknown age.
[3] Rates (for all ages and under one year) exclude deaths of infants dying before registration of birth.
[7] Differs slightly from corresponding rate shown elsewhere because computed on enumerated population rather than midyear estimate.
[23] Rates are for year ended April 1959 and are based on results of 1958-1959 demographic sample survey in 345 villages.
[24] Differs slightly from corresponding rate shown elsewhere because computed on mean of April 1958 and April 1959 population estimates.
[25] Excluding armed forces and foreigners.
[26] Excluding armed forces. Beginning 1955, rates are computed on deaths estimated from experience of 1952-1954.
[27] Data are estimated rates for rural India for period July 1958-July 1959, based on results of 14th round of National Sample Survey.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
† Statistiques établies selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[3] Les taux (tous âges et moins de 1 an) ne tiennent pas compte des décès d'enfants de moins de 1 an survenus avant l'enregistrement de leur naissance.
[7] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base de l'effectif de la population dénombrée et non de l'estimation au milieu de l'année.
[23] Taux se rapportant à la période annuelle se terminant en avril 1959 et calculés d'après des résultats de l'enquête démographique par sondage effectuée en 1958-1959 dans 345 villages.
[24] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il est calculé sur la base d'une moyenne des estimations de la population en avril 1958 et avril 1959.
[25] Non compris les militaires et les étrangers.
[26] Non compris les militaires. A partir de 1955, taux calculés d'après des estimations fondées sur les résultats d'une évaluation concernant les données pour 1952-1953.
[27] Taux estimatifs concernant la population rurale de l'Inde; ces taux ont été obtenus à partir des résultats de la 14ème phase de l'enquête nationale par sondage et se rapportent à la période juillet 1958-juillet 1959.

16. Death rates specific for age and sex (continued) — Taux de mortalité selon l'âge et le sexe (suite)

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Rates known to refer to year of registration rather than occurrence.
[1] Including deaths at unknown age.
[3] Rates (for all ages and under one year) exclude deaths of infants dying before registration of birth.
[7] Differs slightly from corresponding rate shown elsewhere because computed on enumerated population rather than midyear estimate.
[28] Prior to 1957, excluding Bedouin population in the Negev.
[29] Rates are for Jewish population only. For 1952, they exclude 244 deaths of unknown sex, of which 18 are under 1 year, the others age unknown.
[30] Rates are for Japanese nationals in Japan only.
[31] Excluding data for Amami Islands, which were acquired from the Ryukyu Islands on 25 December 1953.
[32] Differs from corresponding rate shown elsewhere because computed on population estimated as of 1 October.
[33] Excluding deaths of unknown sex and age numbering 27 for both sexes.
[34] Rates are based on incomplete data but are computed on total population. In 1952 and 1953, reports were received from only 66 per cent of local civil registrars; in 1956, 1957, 1958 and 1959, from 78, 81, 84 and 84 per cent, respectively.
[35] Excluding Allied military and civilian personnel and their dependants stationed in the area.
[36] Differs from corresponding rate shown elsewhere because computed on population estimated as of 1 December rather than on midyear estimate.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Statistiques établies selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[3] Les taux (tous âges et moins de 1 an) ne tiennent pas compte des décès d'enfants de moins de 1 an survenus avant l'enregistrement de leur naissance.
[7] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base de l'effectif de la population dénombrée et non de l'estimation au milieu de l'année.
[28] Pour les années antérieures à 1957, non compris les Bédouins du Négeb.
[29] Population juive seulement. Pour 1952, non compris 244 décès de sexe inconnu, dont 18 de moins de 1 an, les autres étant d'âge inconnu.
[30] Ne concerne que les nationaux japonais se trouvant au Japon.
[31] Non compris les îles Amami détachées des îles Ryû-kyû et rattachées au Japon le 25 décembre 1953.
[32] Ce taux diffère du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base d'une estimation de population au 1er octobre.
[33] Non compris les décès d'âge et sexe inconnus, au nombre de 27 pour les deux sexes.
[34] Taux calculés en rapportant des données incomplètes à l'effectif total de la population. En 1952 et 1953, des bulletins n'ont été reçus que de 66 pour 100 des bureaux d'état civil, et en 1956, 1957, 1958 et 1959 de 78, 81, 84 et 84 pour 100 respectivement.
[35] Non compris les militaires et agents civils alliés en poste sur le territoire ni les membres de leur famille les accompagnant.
[36] Ce taux diffère du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base d'une estimation de la population au 1er décembre et non au milieu de l'année.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Rates known to refer to year of registration rather than occurrence.
[1] Including deaths at unknown age.
[3] Rates (for all ages and under one year) exclude deaths of infants dying before registration of birth.
[7] Differs slightly from corresponding rate shown elsewhere because computed on enumerated population rather than midyear estimate.
[35] Excluding Allied military and civilian personnel and their dependants stationed in the area.
[37] Rates computed on population excluding transients afloat and non-locally domiciled military and civilian services personnel and their dependants.
[38] Rates exclude deaths of unknown sex numbering 4, of which 3 were under 1 year of age and 1 age unknown.
[39] Differs from corresponding rate shown elsewhere because computed on population estimated from sample demographic survey on 23 February 1956.
[40] Including armed forces stationed outside country but excluding alien armed forces stationed in the area.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Statistiques établies selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[3] Les taux (tous âges et moins de 1 an) ne tiennent pas compte des décès d'enfants de moins de 1 an survenus avant l'enregistrement de leur naissance.
[7] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base de l'effectif de la population dénombrée et non de l'estimation au milieu de l'année.
[35] Non compris les militaires et agents civils alliés en poste sur le territoire ni les membres de leur famille les accompagnant.
[37] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les personnes de passage à bord de navires, ni les militaires et les agents civils domiciliés en dehors du territoire, ni les membres de leur famille les accompagnant.
[38] Non compris 4 décès de sexe inconnu, dont 3 de moins de 1 an et 1 d'âge inconnu.
[39] Ce taux diffère du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base d'une estimation de la population établie à partir des résultats de l'enquête démographique par sondage du 23 février 1956.
[40] Y compris les militaires nationaux hors du pays, mais non compris les militaires étrangers en garnison sur le territoire.

16. Death rates specific for age and sex (continued) — Taux de mortalité selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

Italics: Data are unreliable or of unknown completeness.

* Provisional.

[1] Including deaths at unknown age.

[6] Differs slightly from corresponding rate shown elsewhere because computed on population estimated as of 31 December rather than midyear.

[7] Differs slightly from corresponding rate shown elsewhere because computed on enumerated population rather than midyear estimate.

[13] Rates include deaths among armed forces but are computed on civilian population.

[40] Including armed forces stationed outside country but excluding alien armed forces stationed in the area.

[41] Rates (for all ages and under one year) exclude infants born alive after less than 28 weeks' gestation, of less than 1 000 grammes in weight and 35 centimetres in length, who die within 24 hours of birth.

[42] Excluding Faeroe Islands and Greenland, shown separately. Including armed forces stationed outside country.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.

* Données provisoires.

[1] Y compris les décès d'âge inconnu.

[6] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base d'une estimation de la population au 31 décembre et non au milieu de l'année.

[7] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base de l'effectif de la population dénombrée et non de l'estimation au milieu de l'année.

[13] Taux calculés en rapportant le nombre de décès, y compris ceux des militaires, à l'effectif de la population civile.

[40] Y compris les militaires nationaux hors du pays, mais non compris les militaires étrangers en garnison sur le territoire.

[41] Les taux (tous âges et moins de 1 an) sont calculés à partir de chiffres qui ne comprennent pas les enfants nés vivants après moins de 28 jours de gestation, pesant moins de 1 000 grammes, mesurant moins de 35 centimètres et décédés dans les 24 heures qui ont suivi la naissance.

[42] Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes. Y compris le décès des militaires hors du pays.

16. Death rates specific for age and sex (continued) — Taux de mortalité selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
[1] Including deaths at unknown age.
[43] Including Finnish nationals temporarily outside country.
[44] Rates include deaths among alien armed forces stationed in the area and among national armed forces wherever stationed, but are computed on population excluding alien armed forces and members of career military service outside country, unless on duty in Germany or Austria.
[45] Classification by age based on difference between day, month and year of birth and death for ages under 5 years, and between year of birth and year of death for ages 5 and over.
[46] Rates not computed by the Statistical Office of the United Nations.
[47] Including data for East Berlin.
[48] For 85-89 years.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
[1] Y compris les décès d'âge inconnu.
[43] Y compris les nationaux finlandais se trouvant temporairement hors de Finlande.
[44] Y compris les décès de militaires étrangers en garnison sur le territoire et des militaires français où qu'ils soient en garnison; cependant, les militaires étrangers dans le pays et les militaires français de carrière en garnison hors du pays, à l'exception de ceux qui font partie des forces d'occupation en Allemagne et en Autriche, ne sont pas compris, pour le calcul des taux, dans le chiffre de population auquel est rapporté le nombre de décès.
[45] Le classement selon l'âge repose sur la différence entre la date exacte de la naissance et celle du décès (l'une et l'autre exprimées selon le jour, le mois et l'année) jusqu'à moins de 5 ans et entre l'année de la naissance et celle du décès pour 5 ans et plus.
[46] Le calcul des taux n'a pas été fait au Bureau de statistique des Nations Unies.
[47] Y compris Berlin-Est.
[48] 85-89 ans.

16. Death rates specific for age and sex (continued) — Taux de mortalité selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

Italics: Data are unreliable or of unknown completeness.
† Rates known to refer to year of registration rather than occurrence.
[1] Including deaths at unknown age.
[8] Differs slightly from corresponding rate shown elsewhere because computed on population estimate which excludes migratory balance, not available by age and sex.
[17] Differs slightly from corresponding rate shown elsewhere because computed on mean of end-year estimates rather than midyear.
[46] Rates not computed by the Statistical Office of the United Nations.
[48] For 85-89 years.
[49] Including residents of the Federal Republic of Germany temporarily in West Berlin and excluding alien armed forces and non-resident civilians temporarily in the area.
[50] Excluding the Saar.
[51] Including residents of West Berlin temporarily in the Federal Republic of Germany and excluding alien armed forces and non-resident civilians temporarily in the area.
[52] Rates computed on population including armed forces stationed outside country and excluding alien armed forces stationed in the area.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
† Statistiques établies selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[8] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base d'une estimation de la population qui ne tient pas compte de la balance migratoire, dont la structure par sexe et par âge n'est pas connue.
[17] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base d'une moyenne des estimations à la fin de l'année et non au milieu de l'année.
[46] Le calcul des taux n'a pas été fait au Bureau de statistique des Nations Unies.
[48] 85-89 ans.
[49] Y compris les résidents de la République fédérale d'Allemagne se trouvant temporairement à Berlin-Ouest, mais non compris les membres des familles des militaires français et des civils non résidents se trouvant temporairement sur le territoire.
[50] Non compris la Sarre.
[51] Y compris les résidents de Berlin-Ouest se trouvant temporairement dans la République fédérale d'Allemagne, mais non compris les membres des familles des militaires étrangers et des civils non résidents se trouvant temporairement à Berlin-Ouest.
[52] Taux calculés sur la base d'un chiffre de population qui comprend les militaires nationaux hors du pays mais non les militaires étrangers en garnison sur le territoire.

16. Death rates specific for age and sex (continued) — Taux de mortalité selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Rates known to refer to year of registration rather than occurrence.
[1] Including deaths at unknown age.
[36] Differs from corresponding rate shown elsewhere because computed on population estimated as of 1 December rather than on midyear estimate.
[46] Rates not computed by the Statistical Office of the United Nations.
[52] Rates computed on population including armed forces stationed outside country and excluding alien armed forces stationed in the area.
[53] Infant mortality rate, computed per 1 000 live births.
[54] Includes deaths at unknown age.
[55] Rates based on deaths registered within one year of occurrence.
[56] Differs slightly from corresponding rate shown elsewhere because computed on mean *de jure* rather than midyear *de facto* population.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Statistiques établies selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[36] Ce taux diffère du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base d'une estimation de la population au 1er décembre et non au milieu de l'année.
[46] Le calcul des taux n'a pas été fait au Bureau de statistique des Nations Unies.
[52] Taux calculés sur la base d'un chiffre de population qui comprend les militaires nationaux hors du pays mais non les militaires étrangers en garnison sur le territoire.
[53] Taux de mortalité infantile calculé sur la base de 1 000 naissances vivantes.
[54] Y compris les décès d'âge inconnu.
[55] Taux calculés d'après les décès enregistrés dans l'année qui suit l'événement.
[56] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base de l'effectif moyen de la population de droit et non de fait au milieu de l'année.

16. Death rates specific for age and sex (continued) — Taux de mortalité selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

* Provisional.
† Rates known to refer to year of registration rather than occurrence.
[1] Including deaths at unknown age.
[57] Rates include deaths among armed forces stationed outside country and exclude those among non-Maltese armed forces in the area, but are computed on population excluding non-Maltese armed forces stationed in the area and, beginning 1957, including civilian nationals temporarily outside country.
[58] Including residents outside country if listed in a Netherlands population register and excluding alien armed forces stationed in the area. Prior to 1959, excluding Amboynese living in camps.
[59] Including Norwegian residents temporarily outside country.

* Données provisoires.
† Statistiques établies selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[57] Y compris les décès de militaires nationaux hors du pays, mais non compris les décès de militaires non maltais en garnison sur le territoire. Cependant, les taux sont calculés sur la base d'un chiffre de population qui ne comprend pas les militaires non maltais en garnison sur le territoire, mais qui, à partir de 1957, comprend les civils nationaux temporairement hors du pays.
[58] Y compris les décès de résidents survenus hors du territoire, à condition qu'ils aient été inscrits sur un registre de population néerlandais, mais non compris ceux des militaires étrangers stationnés dans la région. Pour les années antérieures à 1959, non compris les Amboynais vivant dans des camps.
[59] Y compris les décès de résidents norvégiens se trouvant temporairement hors du pays.

16. Death rates specific for age and sex (continued) — Taux de mortalité selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

* Provisional.
[1] Including deaths at unknown age.
[6] Differs slightly from corresponding rate shown elsewhere because computed on population estimated as of 31 December rather than midyear.
[7] Differs slightly from corresponding rate shown elsewhere because computed on enumerated population rather than midyear estimate.
[17] Differs slightly from corresponding rate shown elsewhere because computed on mean of end-year estimates rather than midyear.
[46] Rates not computed by the Statistical Office of the United Nations.

* Données provisoires.
[1] Y compris les décès d'âge inconnu.
[6] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base d'une estimation de la population au 31 décembre et non au milieu de l'année.
[7] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base de l'effectif de la population dénombrée et non de l'estimation au milieu de l'année.
[17] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base d'une moyenne des estimations à la fin de l'année et non au milieu de l'année.
[46] Le calcul des taux n'a pas été fait au Bureau de statistique des Nations Unies.

16. Death rates specific for age and sex (continued) — Taux de mortalité selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

* Provisional.
† Rates known to refer to year of registration rather than occurrence.
[1] Including deaths at unknown age.

* Données provisoires.
† Statistiques établies selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.

16. Death rates specific for age and sex (continued) — Taux de mortalité selon l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Rates known to refer to year of registration rather than occurrence.
[1] Including deaths at unknown age.
[7] Differs slightly from corresponding rate shown elsewhere because computed on enumerated population rather than midyear estimate.
[60] Prior to 1955, excluding Koper and Buje, that part of the former Free Territory of Trieste incorporated in October 1954.
[61] Excluding full-blooded aborigines, estimated at 39 319 in June 1954.
[62] Rates based on deaths for year ended 31 March of year indicated but computed on population enumerated in September of previous year.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Statistiques établies selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[7] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base de l'effectif de la population dénombrée et non de l'estimation au milieu de l'année.
[60] Pour les années antérieures à 1955, non compris Koper et Buje, qui constituent la partie de l'ancien territoire libre de Trieste attribuée à la Yougoslavie en octobre 1954.
[61] Non compris les aborigènes purs, au nombre de 39 319 en juin 1954 (estimation).
[62] Taux calculés en rapportant le nombre des décès survenus au cours de la période annuelle se terminant le 31 mars de l'année indiquée à l'effectif de la population dénombrée en septembre de l'année précédente.

16. Death rates specific for age and sex (continued) — Taux de mortalité selon l'âge et le sexe (suite)

Italics: Data are unreliable or of unknown completeness.
† Rates known to refer to year of registration rather than occurrence.
[1] Including deaths at unknown age.
[7] Differs slightly from corresponding rate shown elsewhere because computed on enumerated population rather than midyear estimate.
[46] Rates not computed by the Statistical Office of the United Nations.

Italique : Données discutables ou dont le degré de complétude n'est pas connu.
† Statistiques établies selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[7] Ce taux diffère légèrement du taux correspondant indiqué ailleurs parce qu'il a été calculé sur la base de l'effectif de la population dénombrée et non de l'estimation au milieu de l'année.
[46] Le calcul des taux n'a pas été fait au Bureau de statistique des Nations Unies.

17. Deaths and death rates by cause, and percentage medically certified : 1955–1960

[Data exclude foetal deaths. Cause of death is classified according to List B, the Abbreviated List of 50 Causes for Tabulation of Mortality of the International Statistical Classification of Diseases, Injuries, and Causes of Death. Rates are the number of deaths from each cause per 100 000 population. Rates are not computed when deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths or when deaths from all causes number less than 1 000; countries where these two limitations apply are identified by the symbol ¶. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 35.]

Italics: Data are unreliable or of unknown completeness.

† Data tabulated by year of registration rather than occurrence.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale : 1955–1960

[Il n'est pas tenu compte des morts fœtales. Les causes de décès sont classées conformément à la Liste B Liste abrégée de 50 rubriques pour la mise en tableaux des causes de mortalité—du Classement statistique international des maladies, traumatismes et causes de décès. Les taux représentent le nombre des décès attribuables à chaque cause pour 100 000 personnes dans la population totale. Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000; les pays auxquels s'appliquent ces deux limitations sont indiqués par le symbole ¶. Les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et les insuffisances des données, voir Notes Techniques, page 87.]

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.
[2] Medical certification reported to cover virtually 100 per cent of deaths.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.
[2] Des certificats médicaux auraient été délivrés pour la presque totalité des décès.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.

† Data tabulated by year of registration rather than occurrence.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[3] Population which has fulfilled certain conditions established by law, i.e., achieved a prescribed degree of material and social development as measured by educational level, language used and mode of living.
[4] For indigenous population only.

[3] Population remplissant certaines conditions fixées par la loi, c'est-à-dire ayant atteint un degré de développement matériel et social déterminé du point de vue du niveau d'instruction, de la langue parlée et du mode de vie.
[4] Population indigène seulement.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.

* Provisional.

† Data tabulated by year of registration rather than occurrence.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[2] Medical certification reported to cover virtually 100 per cent of deaths.
[5] Data exclude deaths of infants dying before registration of birth.
[6] Medical certification reported to cover 69.5 per cent of deaths in 1957; detail by cause not available.
[8] Prior to 31 May 1961, known as Union of South Africa.
[9] Medical certification reported to cover 98.2 per cent of deaths in 1959; detail by cause not available.
[10] Reason for discrepancy between this and corresponding figure shown elsewhere not ascertained.

[2] Des certificats médicaux auraient été délivrés pour la presque totalité des décès.
[5] Non compris les enfants décédés avant l'enregistrement de leur naissance.
[6] 1957: des certificats médicaux auraient été délivrés pour 69,5 pour 100 des décès; la répartition détaillée par cause n'est pas connue.
[8] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.
[9] 1959: des certificats médicaux auraient été délivrés pour 98,2 pour 100 des décès; la répartition détaillée par cause n'est pas connue.
[10] On ne sait pas comment s'explique la divergence entre ce chiffre et le chiffre correspondant indiqué ailleurs.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.

* Provisional.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

* Données provisoires.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[8] Prior to 31 May 1961, known as Union of South Africa.
[9] Medical certification reported to cover 98.2 per cent of deaths in 1959; detail by cause not available.
[11] Medical certification reported to cover 97.5 per cent of deaths in 1959; detail by cause not available.
[12] Medical certification reported to cover 79.1 per cent of deaths in 1959; detail by cause not available.
[13] Medical certification reported to cover 84.4 and 95.1 per cent of deaths in 1955 and 1959 respectively; detail by cause not available.

[8] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.
[9] 1959: des certificats médicaux auraient été délivrés pour 98,2 pour 100 des décès; la répartition détaillée par cause n'est pas connue.
[11] 1959: des certificats médicaux auraient été délivrés pour 97,5 pour 100 des décès; la répartition détaillée par cause n'est pas connue.
[12] 1959: des certificats médicaux auraient été délivrés pour 79,1 pour 100 des décès; la répartition détaillée par cause n'est pas connue.
[13] 1955 et 1959: des certificats médicaux auraient été délivrés pour 84,4 et 95,1 pour 100 des décès respectivement; la répartition détaillée par cause n'est pas connue.

Italics: Data are unreliable or of unknown completeness.

* Provisional.

† Data tabulated by year of registration rather than occurrence.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

[2] Medical certification reported to cover virtually 100 per cent of deaths.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

[2] Des certificats médicaux auraient été délivrés pour la presque totalité des décès.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[14] Between 21 February 1958 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only. The former Syrian Region, which seceded on that date, appears as "Syria" under Asia. Data are for the former Egyptian Region.

[15] Data are medically certified deaths only, comprising 11.0, 16.1, 9.8, 15.4, 19.0 and 23.4 per cent of deaths each year 1955-1960, respectively.

[16] Excluding tourists and United Kingdom and United States armed forces and their dependants stationed in the area.

[17] Deaths in Health Bureau Localities comprise approximately 50 per cent of total deaths.

[18] Data are deaths in hospitals only, comprising 54.0, 60.2, 36.5, 39.3 and 87.6 per cent of deaths each year 1956-1960, respectively.

[19] Excludes deaths from causes B46 and BE47-BE50, inclusive.

[14] 21 février 1958—22 septembre 1961: Région égyptienne et Région syrienne; à partir du 29 septembre 1961, ancienne Région égyptienne seulement. L'ancienne Région syrienne ayant fait sécession à cette date, les données pertinentes figurent en regard de la rubrique "Syrie" sous la rubrique générale "Asie". Données se rapportant à l'ancienne Région égyptienne.

[15] Décès médicalement certifiés seulement, soit 11,0; 16,1; 9,8; 15,4; 19,0 et 23,4 pour 100 des décès pour les années 1955-1960 respectivement.

[16] Non compris les touristes, les militaires du Royaume-Uni et des Etats-Unis en garnison sur le territoire et les membres de leur famille les accompagnant.

[17] Les décès survenus dans les localités dotées d'un bureau d'hygiène représentent environ 50 pour 100 du nombre total des décès.

[18] Décès survenus dans les hôpitaux seulement, soit 54,0; 60,2; 36,5; 39,3 et 87,6 pour cent des décès pour les années 1956-1960 respectivement.

[19] Non compris les décès attribuables aux causes relevant des catégories B46 et BE47 à BE50.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

[2] Medical certification reported to cover virtually 100 per cent of deaths.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

[2] Des certificats médicaux auraient été délivrés pour la presque totalité des décès.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[16] Excluding tourists and United Kingdom and United States armed forces and their dependants stationed in the area.
[20] Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.
[21] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Deaths.
[22] Includes deaths classified only according to the BN categories of the "Nature of Injury" classification (1959, 1 in BN49; 1960, 2 in BN50).

[16] Non compris les touristes, les militaires du Royaume-Uni et des Etats-Unis en garnison sur le territoire et les membres de leur famille les accompagnant.
[20] Y compris les résidents canadiens temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis temporairement au Canada.
[21] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[22] Y compris les décès classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme" (1959: 1 sous BN49; 1960: 2 sous BN50).

17. Deaths and death rates by cause, and percentage medically certified (continued)

Italics: Data are unreliable or of unknown completeness.

† Data tabulated by year of registration rather than occurrence.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

Italics: Data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.
[5] Data exclude deaths of infants dyi g before registration of birth.
[23] Medical certification reported to cover 53.0, 50.8 and 55.8 per cent of deaths each year 1957-1959, respectively; detail by cause not available.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.
[5] Non compris les enfants décédés avant l'enregistrement de leur naissance.
[23] 1957, 1958 et 1959: des certificats médicaux auraient été délivrés pour 53,0; 50,8 et 55,8 pour 100 des décès respectivement; la répartition détaillée par cause n'est pas connue.

17. Deaths and death rates by cause, and percentage medically certified (continued)

Italics: Data are unreliable or of unknown completeness.

* Provisional.

† Data tabulated by year of registration rather than occurrence.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[5] Data exclude deaths of infants dying before registration of birth.
[21] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Deaths.
[24] Medical certification reported to cover 52.6, 39.5 and 45.4 per cent of deaths each year 1955-1957, respectively.
[25] Summation of frequencies for cause groups gives total of 11 491; reason for discrepancy not ascertained.
[26] Deaths coded to categories B29, B37 and B39 are included in B46.

[5] Non compris les enfants décédés avant l'enregistrement de leur naissance.
[21] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[24] 1955, 1956 et 1957: des certificats médicaux auraient été délivrés pour 52,6; 39,5 et 45,4 pour 100 des décès respectivement.
[25] La somme des données pour les différentes rubriques donne un total de 11 491; on ne sait pas comment s'explique la divergence.
[26] Les décès relevant des catégories B29, B37 et B39 sont compris dans B46.

17. Deaths and death rates by cause, and percentage medically certified (continued)

Italics: Data are unreliable or of unknown completeness.
* Provisional.
¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
¶ Il n'a pas été calculé de taux lorsque les décès attributés à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

AMERIQUE DU NORD (suite)

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

[21] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Deaths.

[27] Excluding data for Canal Zone, shown separately above; also excluding Tribal Indian population, numbering 48 654 in 1950 and *60 540 in 1960.

[28] Prior to 1959, excluding Alaska and prior to 1960, excluding Hawaii.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

[21] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.

[27] Non compris la Zone du Canal, qui fait l'objet d'une rubrique distincte; non compris également les Indiens vivant en tribus au nombre de 48 654 en 1950 et *60 540 en 1960.

[28] Pour les années antérieures à 1959, non compris l'Alaska et, pour les années antérieures à 1960, non compris Hawaii.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

* Provisional.

† Data tabulated by year of registration rather than occurrence.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

[2] Medical certification reported to cover virtually 100 per cent of deaths.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

[2] Des certificats médicaux auraient été délivrés pour la presque totalité des décès.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

Voir note au début du tableau.]

[10] Reason for discrepancy between this and corresponding figure shown elsewhere not ascertained.
[21] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Deaths.
[28] Prior to 1959, excluding Alaska and prior to 1960, excluding Hawaii.
[29] Data are based on a 10 per cent sample of death certificates.
[30] Summation of frequencies for cause groups gives total of 538 in 1959 and 465 in 1960; reason for discrepancy not ascertained.
[31] Deaths coded to categories B4, B5, B11, B13, B15, and B16 are included in B17.
[32] Of which 6 in BE47, 10 in BE48, 2 in BE50 and 42 classified only according to the BN categories of the "Nature of Injury" classification.

[10] On ne sait pas comment s'explique la divergence entre ce chiffre et le chiffre correspondant indiqué ailleurs.
[21] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[28] Pour les années antérieures à 1959, non compris l'Alaska et, pour les années antérieures à 1960, non compris Hawaii.
[29] D'après un échantillon de 10 pour 100 des certificats de décès.
[30] La somme des données pour les différentes rubriques donne un total de 538 pour 1959 et de 465 pour 1960; on ne sait pas comment s'explique la divergence.
[31] Les décès relevant des catégories B4, B5, B11, B13, B15 et B16 sont compris dans B17.
[32] Dont 6 sous BE47, 10 sous BE48, 2 sous BE50 et 42 classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme".

17. Deaths and death rates by cause, and percentage medically certified (continued)

* Provisional.

† Data tabulated by year of registration rather than occurrence.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

[2] Medical certification reported to cover virtually 100 per cent of deaths.

[10] Reason for discrepancy between this and corresponding figure shown elsewhere not ascertained.

[33] Data are medically certified deaths only, comprising 65.5 per cent of deaths.

[34] Summation of frequencies for cause groups gives total of 665; reason for discrepancy not ascertained.

[35] Summation of frequencies for cause groups gives total of 1 268; reason for discrepancy not ascertained.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

[2] Des certificats médicaux auraient été délivrés pour la presque totalité des décès.

[10] On ne sait pas comment s'explique la divergence entre ce chiffre et le chiffre correspondant indiqué ailleurs.

[33] Décès médicalement certifiés, soit 65,5 pour 100 du nombre total des décès.

[34] La somme des données pour les différentes rubriques donne un total de 665; on ne sait pas comment s'explique la divergence.

[35] La somme des données pour les différentes rubriques donne un total de 1 268; on ne sait pas comment s'explique la divergence.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[36] Medical certification reported to cover virtually 100% of deaths except for B17, B26 and B43 in 1955.

[37] Of which 6 in BE47, 6 in BE48, 2 in BE49 and 43 classified only according to the BN categories of the "Nature of Injury" classification.

[38] Of which 4 in BE48, one each in BE49 and BE50, and 32 classified only according to the BN categories of the "Nature of Injury" classification.

[39] Of which 3 in BE47, 2 in BE48, and 55 classified only according to the BN categories of the "Nature of Injury" classification.

[40] Of which 3 in BE48 and 2 in BE49, and 25 classified only according to the BN categories of the "Nature of Injury" classification.

[41] Of which 40 in BE47, 5 in BE48 and 12 classified only according to the BN categories of the "Nature of Injury" classification.

[42] Of which 2 in BE48, 1 in BE49 and 18 classified only according to the BN categories of the "Nature of Injury" classification.

[43] Of which 23 in BE48, 1 in BE49 and 10 classified only according to the BN categories of the "Nature of Injury" classification.

[36] Des certificats médicaux auraient été délivrés pour la presque totalité des décès, exception faite de ceux qui relèvent des catégories B17, B26 et B43 en 1955.

[37] Dont 6 sous BE47, 6 sous BE48, 2 sous BE49 et 43 classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme".

[38] Dont 4 sous BE48, 1 sous BE49 et BE50 et 32 classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme".

[39] Dont 3 sous BE47, 2 sous BE48 et 55 classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme".

[40] Dont 3 sous BE48, 2 sous BE49 et 25 classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme".

[41] Dont 40 sous BE47, 5 sous BE48 et 12 classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme".

[42] Dont 2 sous BE48, 1 sous BE49 et 18 classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme".

[43] Dont 23 sous BE48, 1 sous BE49 et 10 classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme".

17. Deaths and death rates by cause, and percentage medically certified (continued)

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[2] Medical certification reported to cover virtually 100 per cent of deaths.
[44] Includes deaths not medically certified and therefore not tabulated by cause, numbering 12, 6, 3 and 4 each year 1956-1959, respectively.

[2] Des certificats médicaux auraient été délivrés pour la presque totalité des décès.
[44] Y compris les décès qui, n'ayant pas fait l'objet d'un certificat médical, ne sont pas classés selon la cause, au nombre de 12, 6, 3 et 4 en 1956, 1957, 1958 et 1959 respectivement.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

Italics: Data are unreliable or of unknown completeness.

* Provisional.

† Data tabulated by year of registration rather than occurrence.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[5] Data exclude deaths of infants dying before registration of birth.
[47] Excluding Indian jungle population.
[48] Data are for an area covered by 44 Health Units and 76 Health Posts, which is not representative of Paraguay and for which population is not available.
[49] Excluding Indian jungle population, estimated at 350 000 in 1940.
[50] Data are medically certified deaths only, comprising 36.8, 39.4, 40.2, 42.8 and 44.4 per cent of deaths each year 1955-1958, respectively.

[5] Non compris les enfants décédés avant l'enregistrement de leur naissance.
[47] Non compris les Indiens de la jungle.
[48] Les données se rapportent à une région, desservie par 44 centres sanitaires et 76 postes sanitaires, qui n'est pas représentative de l'ensemble du Paraguay et dont le nombre d'habitants n'est pas connu.
[49] Non compris les Indiens de la jungle, au nombre de 350 000 en 1940 (estimation).
[50] Décès médicalement certifiés seulement, soit 36,8; 39,4; 40,2; 42,8 et 44,4 pour 100 du nombre total des décès pour les années 1955-1958 respectivement.

17. Deaths and death rates by cause, and percentage medically certified (continued)

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.
[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.
[5] Data exclude deaths of infants dying before registration of birth.
[51] Excluding Indian and Negro population living in tribes, estimated at 26 000 in 1955-1957.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.
[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.
[5] Non compris les enfants décédés avant l'enregistrement de leur naissance.
[51] Non compris les Indiens et les Noirs vivant en tribus, au nombre de 26 000 en 1955-1957 (estimation).

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[52] Medical certification reported to cover 65 per cent of deaths; detail by cause not available.

[53] Medical certification reported to cover virtually 100 per cent of deaths except for B45, BE48 and BE50.

[54] Data are medically certified deaths only, comprising approximately 90 per cent of total deaths.

[55] Medical certification reported to cover virtually 100 per cent of deaths in 1956.

[56] Excluding dependencies; also excluding deaths among armed forces and in port, but rates computed on population including them.

[57] Data are for a changing number of towns having a present population of approximately 2 million.

[52] Des certificats médicaux auraient été délivrés pour 65 pour 100 des décès; la répartition détaillée par cause n'est pas connue.

[53] Des certificats médicaux auraient été délivrés pour la presque totalité des décès, exception faite de ceux qui relèvant des catégories B45, BE48 et BE50.

[54] Décès médicalement certifiés seulement, soit 90 pour 100 environ du nombre total des décès.

[55] 1956: des certificats médicaux auraient été délivrés pour la presque totalité des décès.

[56] Non compris les dépendances; non compris également les militaires et compte non tenu du port; toutefois, les taux sont calculés sur la base d'un chiffre de population les comprenant.

[57] Les données se rapportent à un nombre variable de villes comptant environ 2 millions d'habitants.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.
[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.
[5] Data exclude deaths of infants dying before registration of birth.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.
[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.
[5] Non compris les enfants décédés avant l'enregistrement de leur naissance.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

Voir note au début du tableau.]

ASIE (suite

[58] Excluding armed forces and foreigners.
[59] Reported deaths only, and excluding armed forces. For estimated total deaths, based on experience of 1952-1954, see Table 14.
[60] Medical certification reported to cover virtually 100 per cent of deaths except for B45.
[61] Excluding deaths certified by herbalists.
[62] Of which 217 in BE47, 927 in BE48, 285 in BE49, 434 in BE50 (excluding E964 and E965) and 620 classified only according to the BN categories of the "Nature of Injury" classification.
[63] Of which 197 in BE47, 988 in BE48, 242 in BE49, 348 in BE50 (excluding E964 and E965) and 311 classified only according to the BN categories of the "Nature of Injury" classification.

[58] Non compris les militaires et les étrangers.
[59] Décès enregistrés seulement et non compris les militaires. Pour l'estimation du nombre total des décès établie d'après les données concernant la période 1952-1954, voir tableau 14.
[60] Des certificats médicaux auraient été délivrés pour la presque totalité des décès, exception faite de ceux qui relèvent de la catégorie B45.
[61] Non compris les décès certifiés par les herboristes.
[62] Dont 217 sous BE47, 927 sous BE48, 285 sous BE49, 434 sous BE50 (non compris E964 et E965) et 620 classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme".
[63] Dont 197 sous BE47, 988 sous BE48, 242 sous BE49, 348 sous BE50 (non compris E964 et E965) et 311 classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme".

17. Deaths and death rates by cause, and percentage medically certified (continued)

Italics: Data are unreliable or of unknown completeness.

† Data tabulated by year of registration rather than occurrence.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

7. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[2] Medical certification reported to cover virtually 100 per cent of deaths.
[60] Medical certification reported to cover virtually 100 per cent of deaths except for B45.
[64] Data are for Japanese nationals in Japan only.
[65] Rates computed on population excluding armed forces.
[66] Some deaths coded B17 and B48 appear to be included in B46.

[2] Des certificats médicaux auraient été délivrés pour la presque totalité des décès.
[60] Des certificats médicaux auraient été délivrés pour la presque totalité des décès, exception faite de ceux qui relèvent de la catégorie B45.
[64] Les données ne concernent que les nationaux japonais se trouvant au Japon.
[65] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires.
[66] Les décès relevant des catégories B17 et B48 sont compris dans B46.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.
[64] Data are for Japanese nationals in Japan only.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.
[64] Les données ne concernent que les nationaux japonais se trouvant au Japon.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

Voir note au début du tableau.]

[67] Data include late foetal deaths.
[68] Excluding foreigners but including registered Palestinian refugees; for number of refugees, see Table 4.
[69] Data are deaths recorded by Health Service only.
[70] Of which 98 in BE47, 2 409 in BE48, 180 in BE49, 1 002 in BE50 and 1 942 classified only according to the BN categories of the "Nature of Injury" classification.

[67] Y compris les morts fœtales tardives.
[68] Non compris les étrangers, mais y compris les réfugiés palestiniens immatriculés; pour le nombre de réfugiés, voir le tableau 4.
[69] Les données représentent les décès enregistrés par le Service de la santé seulement.
[70] Dont 98 sous BE47, 2 409 sous BE48, 180 sous BE49, 1 002 sous BE50 et 1 942 classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme".

17. Deaths and death rates by cause, and percentage medically certified (continued)

(See note at head of table.)

Italics: Data are unreliable or of unknown completeness.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

[5] Data exclude deaths of infants dying before registration of birth.

[9] Medical certification reported to cover 98.2 per cent of deaths in 1959; detail by cause not available.

[71] Data are incomplete returns but rates are computed on total population; in 1956-1959, reports were received from only 78, 81, 84 and 84 per cent of local civil registrars, respectively.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

[5] Non compris les enfants décédés avant l'enregistrement de leur naissance.

[9] 1959: des certificats médicaux auraient été délivrés pour 98,2 pour 100 des décès; la répartition détaillée par cause n'est pas connue.

[71] Données incomplètes; toutefois les taux sont calculés sur la base de la population totale; 1956-1959: des renseignements n'ont été reçus que de 78, 81, 84 et 84 pour 100 des officiers d'état civil.

7. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

oir note au début du tableau.]

[72] Data exclude deaths in *concelho* de Nagar-Aveli (which had a population of 41 532 at 1950 census) but rates are computed on total population.

[73] Data are medically certified deaths only, comprising approximately 4 per cent of recorded deaths.

[74] Excluding deaths among Allied military and civilian personnel and their dependants stationed in area.

[75] Of which 289 in BE47, 2 767 in BE48, 198 in BE49, 729 in BE50 and 1 873 classified only according to the BN categories of the "Nature of Injury" classification.

[76] Of which 555 in BE47, 4 371 in BE48, 185 in BE49, 886 in BE50 and 3 221 classified only according to the BN categories of the "Nature of Injury" classification.

[77] Of which 534 in BE47, 2 465 in BE48, 169 in BE49, 744 in BE50 and 3 015 classified only according to the BN categories of the "Nature of Injury" classification.

[72] Non compris les décès survenus dans le *concelho* de Nagar-Aveli, qui comptait 41 532 habitants lors du recensement de 1950; toutefois les taux sont calculés sur la base de la population totale.

[73] Décès médicalement certifiés seulement, soit environ 4 pour 100 des décès enregistrés.

[74] Non compris les décès survenus parmi les militaires et agents civils alliés en garnison sur le territoire et les membres de leur famille les accompagnant.

[75] Dont 289 sous BE47, 2 767 sous BE48, 198 sous BE49, 729 sous BE50 et 1 873 classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme".

[76] Dont 555 sous BE47, 4 371 sous BE48, 185 sous BE49, 886 sous BE50 et 3 221 classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme".

[77] Dont 534 sous BE47, 2 465 sous BE48, 169 sous BE49, 744 sous BE50 et 3 015 classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme".

17. Deaths and death rates by cause, and percentage medically certified (continued)

Italics: Data are unreliable or of unknown completeness.

† Data tabulated by year of registration rather than occurrence.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[78] Rates computed on population excluding transients afloat and non-locally domiciled military and civilian services personnel and their dependants.

[79] Of which 22 in BE48, 4 each in BE49 and BE50 and 24 classified only according to the BN categories of the "Nature of Injury" classification.

[80] Of which 2 in BE47, 42 in BE48, 18 in BE49, 2 in BE50, and 7 classified only according to the BN categories of the "Nature of Injury" classification.

[78] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les personnes de passage à bord de navires, ni les militaires et les fonctionnaires civils domiciliés en dehors du territoire et les membres de leur famille les accompagnant.

[79] Dont 22 sous BE48, 4 sous BE49 et BE50 et 24 classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme".

[80] Dont 2 sous BE47, 42 sous BE48, 18 sous BE49, 2 sous BE50 et 7 classés seulement par catégorie à indicatif BN du classement selon la "nature du traumatisme".

Italics: Data are unreliable or of unknown completeness.

† Data tabulated by year of registration rather than occurrence.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

[5] Data exclude deaths of infants dying before registration of birth.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

[5] Non compris les enfants décédés avant l'enregistrement de leur naissance.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[81] Formerly Syrian Region of United Arab Republic; reverted to status of independent nation 29 September 1961.

[82] Data are medically certified deaths only comprising 74 per cent of deaths registered within one month of occurrence in 1960.

[83] Data for 1955 and 1956 are deaths in provincial capitals only; beginning March 1957, data are for provincial capitals and district centers.

[84] Data are for March to December only.

[85] Late effects of injury purposely inflicted by another person (not in war) (E964) and Late effects of injuries due to war operations (E965) included with All other accidents (BE48) rather than with Homicide and operations of war (BE50).

[81] Ancienne Région syrienne de la République arabe unie, redevenue état indépendant le 29 septembre 1961.

[82] 1960: décès médicalement certifiés seulement, soit 74 pour 100 des décès enregistrés dans le mois de l'événement.

[83] 1955 et 1956: capitales de provinces seulement; à partir de mars 1957, capitales de provinces et chefs-lieux de districts.

[84] Mars-décembre seulement.

[85] Les Séquelles d'une blessure faite intentionnellement par une autre personne (à l'exception des faits de guerre) (E964) et les Séquelles de blessures de guerre (E965) sont classées sous Tous autres accidents (BE48) et non sous Homicide et blessures de guerre (BE50).

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

† Data tabulated by year of registration rather than occurrence.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

[2] Medical certification reported to cover virtually 100 per cent of deaths.

[85] Late effects of injury purposely inflicted by another person (not in war) (E964) and Late effects of injuries due to war operations (E965) included with All other accidents (BE48) rather than with Homicide and operations of war (BE50).

[86] Including armed forces stationed outside country but excluding alien armed forces stationed in the area.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[1] En ce qui concern le titre de chaque groupe de causes et les catégories de la Nomenclature détailée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

[2] Des certificats médicaux auraient été délivrés pour la presque totalité des décès.

[85] Les Séquelles d'une blessure faite intentionnellement par une autre personne (à l'exception des faits de guerre) (E964) et les Séquelles de blessures de guerre (E965) sont classées sous Tous autres accidents (BE48) et non sous Homicide et blessures de guerre (BE50).

auraient été délivrés pour la presque totalité des décès, exception faite de

[86] Y compris les militaires en garnison hors du pays, mais non compris les militaires étrangers en garnison sur le territoire.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[87] Excluding dependencies of Guernsey. Medical certification in Jersey reported to cover virtually 100 per cent of deaths except for B33 in 1957, B40 in 1957 and 1958, B42 in 1958 and BE48 in 1955-1960. Medical certification reported to be 100 per cent complete in Guernsey in 1955.

[88] Data are for towns only.

[89] Food poisoning (049) and late effects of acute poliomyelitis (081) included in B6 and B12, respectively, rather than in B17.

[90] Excludes Streptococcal sore throat (051).

[91] Other diseases of heart (430-434) included in B25 rather than in B27.

[92] Cirrhosis of liver (581) is included in B46 rather than B37.

[93] Neonatal disorders arising from maternal toxaemia (769) included in B43 rather than in B44.

[87] Non compris les dépendances de Guernesey. Jersey: des certificats médicaux auraient été délivrés pour la presque totalité des décès, exception faite de ceux qui relèvent des catégories ci-après: B33 en 1957, B40 en 1957 et 1958, B42 en 1958 et BE48 en 1955-1960. Guernesey—1955: des certificats médicaux auraient été délivrés pour la totalité des décès.

[88] Les données ne concernent que les villes.

[89] Les Infections et intoxications alimentaires (049) et les Séquelles de la poliomyélite aiguë (081) sont classées sous B6 et B12 respectivement et non sous B17.

[90] Non compris l'Angine à streptocoques (051).

[91] Autres maladies du cœur (430-434) classés sous B25 et non sous B27.

[92] Cirrhose du foie (581) classée sous B46 et non sous B37.

[93] Les Intoxications du nouveau-né par toxémie maternelle (769) sont classées sous B43 et non sous B44.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

† Data tabulated by year of registration rather than occurrence.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

[2] Medical certification reported to cover virtually 100 per cent of deaths.

[21] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Deaths.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

[2] Des certificats médicaux auraient été délivrés pour la presque totalité des décès.

[21] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[87] Excluding dependencies of Guernsey. Medical certification in Jersey reported to cover virtually 100 per cent of deaths except for B33 in 1957, B40 in 1957 and 1958, B42 in 1958 and BE48 in 1955-1960. Medical certification reported to be 100 per cent complete in Guernsey in 1955.

[94] Data exclude deaths of infants born alive after less than 28 weeks' gestation, less than 1 000 grammes in weight and 35 centimetres in length, who die within 24 hours of birth.

[95] Medical certification reported to cover virtually 100 per cent of total deaths in 1958 and 1959.

[96] Excluding Faeroe Islands, shown separately, and Greenland. Including armed forces stationed outside country.

[87] Non compris les dépendances de Guernesey. Jersey: des certificats médicaux auraient été délivrés pour la presque totalité des décès, exception faite de ceux qui relèvent des catégories ci-après: B33 en 1957, B40 en 1957 et 1958, B42 en 1958 et BE48 en 1955-1960. Guernesey—1955: des certificats médicaux auraient été délivrés pour la totalité des décès.

[94] Non compris les enfants nés vivants après moins de 28 semaines de gestation, pesant moins de 1 000 grammes, mesurant moins de 35 centimètres et décédés dans les 24 heures qui ont suivi leur naissance.

[95] 1958 et 1959: des certificats médicaux auraient été délivrés pour la presque totalité des décès.

[96] Non compris les îles Féroé qui font l'objet de rubriques distinctes, ni le Groenland. Y compris les militaires en garnison hors du pays.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.

* Provisional.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

* Données provisoires.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[5] Data exclude deaths of infants dying before registration of birth.
[21] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Deaths.
[97] Including nationals temporarily outside country.
[98] Data include deaths among armed forces outside country, but rates are computed on population excluding alien armed forces and members of career military service outside country, unless on duty in Germany and Austria.

[5] Non compris les enfants décédés avant l'enregistrement de leur naissance.
[21] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[97] Y compris les nationaux temporairement hors du pays.
[98] Y compris les décès survenus parmi les militaires hors du pays, toutefois les taux sont calculés sur la base d'un chiffre de population qui ne comprend pas les militaires étrangers ni les militaires nationaux de carrière stationnés hors du pays à l'exception de ceux qui font partie des forces d'occupation en Allemagne ou en Autriche.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.
[2] Medical certification reported to cover virtually 100 per cent of deaths.
[5] Data exclude deaths of infants dying before registration of birth.
[21] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Deaths.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.
[2] Des certificats médicaux auraient été délivrés pour la presque totalité des décès.
[5] Non compris les enfants décédés avant l'enregistrement de leur naissance.
[21] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[98] Data include deaths among armed forces outside country, but rates are computed on population excluding alien armed forces and members of career military service outside country, unless on duty in Germany and Austria.

[99] Including residents of the Federal Republic of Germany temporarily in West Berlin and excluding alien armed forces and non-resident civilians temporarily in the area.

[100] Including residents of West Berlin temporarily in the Federal Republic of Germany and excluding alien armed forces and non-resident civilians temporarily in the area.

[98] Y compris les décès survenus parmi les militaires hors du pays; toutefois les taux sont calculés sur la base d'un chiffre de population qui ne comprend pas les militaires étrangers ni les militaires nationaux de carrière stationnés hors du pays à l'exception de ceux qui font partie des forces d'occupation en Allemagne ou en Autriche.

[99] Y compris les résidents de la République fédérale d'Allemagne temporairement à Berlin-Ouest, mais non compris les militaires étrangers et les civils non résidents temporairement dans la République fédérale d'Allemagne.

[100] Y compris les résidents de Berlin-Ouest temporairement dans la République fédérale d'Allemagne, mais non compris les militaires étrangers et les civils non résidents temporairement à Berlin-Ouest.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

[2] Medical certification reported to cover virtually 100 per cent of deaths.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

[2] Des certificats médicaux auraient été délivrés pour la presque totalité des décès.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[21] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Deaths.

[100] Including residents of West Berlin temporarily in the Federal Republic of Germany and excluding alien armed forces and non-resident civilians temporarily in the area.

[101] For 1956-1958 and 1960, excluding non-resident population. In 1960 medical certification reported to cover 100 per cent of deaths except for B26 and BE48.

[102] Computed on population including armed forces stationed outside country and excluding alien armed forces stationed in the area.

[21] Décès classés suivant les catégories de la Septième Revision, 1955, des Nomenclatures internationales des maladies et causes de décès.

[100] Y compris les résidents de Berlin-Ouest temporairement dans la République fédérale d'Allemagne, mais non compris les militaires étrangers et les civils non résidents temporairement à Berlin-Ouest.

[101] 1956-1958 et 1960: non compris les non résidents. 1960: des certificats médicaux auraient été délivrés pour la presque totalité des décès, exception faite de ceux qui relèvent des catégories B26 et BE48.

[102] Taux calculés sur la base d'un chiffre de population comprenant les militaires en garnison hors du pays, mais non les militaires étrangers en garnison sur le territoire.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

[103] Medical certification reported to cover 100 per cent of total deaths except for B45 in 1956 and 1957, and BE48 in 1955-1960.

[104] Data are deaths registered within one year of occurrence.

[103] Des certificats médicaux auraient été délivrés pour la presque totalité des décès, exception faite de ceux qui relèvent des catégories ci-après: B45 en 1956 et 1957 et BE48 en 1955-1960.

[104] Les données représentent les décès enregistrés dans l'année de l'événement.

17. Deaths and death rates by cause, and percentage medically certified (continued)

* Provisional.
† Data tabulated by year of registration rather than occurrence.
¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.
[2] Medical certification reported to cover virtually 100 per cent of deaths.
[21] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Deaths.
[104] Data are deaths registered within one year of occurrence.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.
[2] Des certificats médicaux auraient été délivrés pour la presque totalité des décès.
[21] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[104] Les données représentent les décès enregistrés dans l'année de l'événement.

17. Deaths and death rates by cause, and percentage medically certified (continued)

† Data tabulated by year of registration rather than occurrence.
[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.
[2] Medical certification reported to cover virtually 100 per cent of deaths.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.
[2] Des certificats médicaux auraient été délivrés pour la presque totalité des décès.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[105] Data include deaths of armed forces stationed outside country and exclude those among non-Maltese armed forces in the area but rates computed on population excluding non-Maltese armed forces stationed in the area and, beginning 1957, including civilian nationals temporarily outside country.

[105] Y compris les décès de militaires nationaux hors du pays, mais non compris les décès des militaires non maltais en garnison sur le territoire. Les taux sont calculés sur la base d'un chiffre de population qui ne comprend pas les militaires non maltais en garnison sur le territoire mais qui, à partir de 1957, comprend les civils nationaux temporairement hors du pays.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

¶ Rates not computed either because deaths due to senility, ill-defined and unknown causes (B45) exceed 25 per cent of total deaths, or because deaths from all causes number less than 1 000.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

[2] Medical certification reported to cover virtually 100 per cent of deaths.

[21] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Deaths.

[106] Excluding alien armed forces stationed in the area, and prior to 1959 Amboynese living in camps. Including residents outside country if listed in a Netherlands population register.

¶ Il n'a pas été calculé de taux lorsque les décès attribués à la sénilité ou à des causes mal définies ou inconnues (B45) représentent plus de 25 pour 100 du total des décès, ni lorsque le nombre des décès pour toutes les causes est inférieur à 1 000.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

[2] Des certificats médicaux auraient été délivrés pour la presque totalité des décès.

[21] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.

[106] Non compris les militaires étrangers en garnison sur le territoire et, pour les années antérieures à 1959, non compris les Amboinais vivant dans les camps. Y compris les résidents en dehors du pays s'ils sont inscrits sur un registre de population néerlandais.

7. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[107] Including residents temporarily outside country.
[108] Exanthematic typhus (100) and some other diseases correctly coded to B15 are included in B2.
[109] Deaths from Meningococcal meningitis only (057).
[110] Excludes Thrombosis of spinal cord (part of 334) which is included in B46.
[111] Chronic rheumatic heart disease (410-416) and chronic endocarditis (421) included in B27.
[112] Included in B46.
[113] Prostatitis (611) and other diseases of Prostate (612) included in B39 rather than B46.
[114] Includes Thromboses of spinal cord (part of 334) and Cirrhosis of the liver (583); excludes Prostatitis (611) and other diseases of the prostate (612) which are included in B39.

[107] Y compris les résidents temporairement hors du pays.
[108] Le Typhus exanthématique (100) et certaines autres maladies correctement classées dans la catégorie B15 sont comprises dans B2.
[109] Méningite à méningocoques seulement (057).
[110] Non compris la Thrombose de la mœlle (dans 334) qui est classée sous B46.
[111] Cardiopathie rhumatismale chronique (410-416) et endocardite chronique (421) classés sous B27 et non B26.
[112] Compris dans B46.
[113] Prostatite (611) et Autres maladies de la prostate classées sous B39 et non sous B46.
[114] Y compris la Thrombose de la mœlle (dans 334) et la Cirrhose du foie (583); non compris la Prostatite (611) et les Autres maladies de la prostate (612) qui sont classées sous B39.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

[2] Medical certification reported to cover virtually 100 per cent of deaths.

[21] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Deaths.

[108] Exanthematic typhus (100) and some other diseases correctly coded to B15 are included in B2.

[109] Deaths from Meningococcal meningitis only (057).

[110] Excludes Thrombosis of spinal cord (part of 334) which is included in B46.

[111] Chronic rheumatic heart disease (410-416) and chronic endocarditis (421) included in B27.

[112] Included in B46.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

[2] Des certificats médicaux auraient été délivrés pour la presque totalité des décès.

[21] Décès classés suivant les catégories de la Septième Revision, 1955, des Nomenclatures internationales des maladies et causes de décès.

[108] Le Typhus exanthématique (100) et certaines autres maladies correctement classées dans la catégorie B15 sont comprises dans B2.

[109] Méningite à méningocoques seulement (057).

[110] Non compris la Thrombose de la mœlle (dans 334) qui est classée sous B46.

[111] Cardiopathie rhumatismale chronique (410-416) et endocardite chronique (421) classée sous B27 et non B26.

[112] Compris dans B46.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[113] Prostatitis (611) and other diseases of Prostate (612) included in B39 rather than B46.

[114] Includes Thromboses of spinal cord (part of 334) and Cirrhosis of the liver (583); excludes Prostatitis (611) and other diseases of the prostate (612) which are included in B39.

[115] Medical certification reported to cover 79.7, 81.1, and 82.8 per cent of deaths each year 1957-1959, respectively; detail by cause not available.

[116] Data exclude deaths of infants dying within 24 hours of birth.

[113] Prostatite (611) et Autres maladies de la prostate classées sous B39 et non sous B46.

[114] Y compris la Thrombose de la mœlle (dans 334) et la Cirrhose du foie (583); non compris la Prostatite (611) et les Autres maladies de la prostate (612) qui sont classées sous B39.

[115] 1957, 1958 et 1959: des certificats médicaux auraient été délivrés pour 79,7; 81,1 et 82,8 pour cent des décès respectivement; la répartition détaillée n'est pas connue.

[116] Non compris les enfants décédés dans les 24 heures de leur naissance.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[21] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Deaths.

[60] Medical certification reported to cover virtually 100 per cent of deaths except for B45.

[21] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.

[60] Des certificats médicaux auraient été délivrés pour la presque totalité des décès, exception faite de ceux qui relèvent de la catégorie B45.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.
[21] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Deaths.

* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.
[21] Décès classés suivant les catégories de la Septième Revision, 1955, des Nomenclatures internationales des maladies et causes de décès.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[117] Excluding data for full-blooded aborigines, estimated at 39 319 in June 1954.
[118] Comprising approximately 30 per cent of total population and representative of the urban area of the country.
[119] Percentages below refer to deaths in the Tabulation Area only; corresponding percentage for total deaths in 1959 was 42.6.

[117] Non compris les aborigènes de race pure, au nombre de 39 319 en juin 1954 (estimation).
[118] Zone comptant environ 30 pour 100 de la population totale et représentative de la zone urbaine du pays.
[119] Les taux publiés ne se refèrent qu'aux décès survenus dans la zone d'exploitation, pour l'ensemble des décès survenus en 1959, le chiffre correspondant s'établissait à 42,6 pour 100.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

† Data tabulated by year of registration rather than occurrence.

[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.

[21] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Deaths.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.

[21] Décès classés suivant les catégories de la Septième Revision, 1955, des Nomenclatures internationales des maladies et causes de décès.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[117] Excluding data for full-blooded aborigines, estimated at 39 319 in June 1954.
[120] Prior to 1958, data are for years ended 31 March. Medical certification reported to cover 100 per cent of total deaths except for BE48 in 1958, and B27, B46 and BE48 in 1959.
[121] Medical certification reported to cover virtually 100 per cent of deaths each year 1956-1959.
[121a] Excluding alien armed forces stationed in the area.

[117] Non compris les aborigènes de race pure, au nombre de 39 319 en juin 1954 (estimation).
[120] Pour les années antérieures à 1958, les données se rapportent à des périodes annuelles se terminant le 31 mars. Des certificats médicaux auraient été délivrés pour la presque totalité des décès, exception faite de ceux qui relèvent des catégories ci-après: BE48 en 1958 et B27, B46 et BE48 en 1959.
[121] 1956, 1958 et 1959: des certificats médicaux auraient été délivrés pour la presque totalité des décès.
[121a] Non compris les militaires en garnison sur le territoire.

17. Deaths and death rates by cause, and percentage medically certified (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] For title of each cause group and Detailed List categories included, see beginning of table for English and end of table for French.
[21] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Deaths.
[121a] Excluding alien armed forces stationed in the area.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] En ce qui concerne le titre de chaque groupe de causes et les catégories de la Nomenclature détaillée utilisées, voir le début du tableau pour le texte anglais et la fin du tableau pour le texte français.
[21] Décès classés suivant les catégories de la Septième Revision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[121a] Non compris les militaires en garnison sur le territoire.

17. Décès selon la cause, nombres et taux, pourcentage de certification médicale (suite)

[Voir note au début du tableau.]

[122] Excluding deaths among Maori population, numbering 1 272 in 1955, 1 293 in 1956, and 1 451 in 1957.

[123] Medical certification reported to cover 100 per cent of total deaths except for B17 in 1958 and 1959, B27 in 1957, 1959 and 1960, B33 in 1958, B45 in 1957 and B46 in 1958 and 1960.

[124] Excluding Saipan.

[125] Data are medically certified deaths among Tongan population only, comprising 49.4 per cent of total deaths among Tongan population in 1956 and 39.1 per cent in 1957.

[126] Data are deaths known to hospital authorities, comprising 68.8 per cent of total deaths.

[122] Non compris les décès de Maoris, au nombre de 1 272 en 1955, 1 293 en 1956 et 1 451 en 1957.

[123] Des certificats médicaux auraient été établis pour la totalité des décès, exception faite de ceux qui relèvent des catégories ci-après: B17 en 1958 et 1959, B27 en 1957, 1959 et 1960, B33 en 1958, B45 en 1957 et B46 en 1958 et 1960.

[124] Non compris Saipan.

[125] Décès médicalement certifiés dans la population tongane seulement, soit 49,4 pour 100 du nombre total des décès de Tongans en 1956 et 39,1 pour 100 en 1957.

[126] Décès attestés par les autorités hospitalières, soit 68,8 pour 100 du nombre total des décès.

18. Deaths by cause, age and sex : latest available year — Décès selon la cause, l'âge et le sexe : dernière année disponible

[Data exclude foetal deaths. Unless otherwise noted, cause of death is classified according to List B, the Abbreviated List of 50 Causes for Tabulation of Mortality, of the Sixth (1948) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death. For full titles of cause groups and Detailed List categories included, see Table 17. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 36. — Il n'est pas tenu compte des morts fœtales. Sauf indication contraire, les causes de décès sont classées conformément à la liste B — Liste abrégée de 50 rubriques pour la mise en tableaux des causes de mortalité — de la Sixième Revision (1948) du Classement statistique international des maladies, traumatismes et causes de décès. Pour la désignation complète des groupes de causes et les catégories de la Liste détaillée comprises dans ces groupes, voir le tableau 17. Les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et les insuffisances des données, voir Notes Techniques, page 89.]

† Data tabulated by year of registration rather than occurrence.
[1] Prior to 31 May 1961, known as Union of South Africa.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.

18. Deaths by cause, age and sex (continued) — Décès selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

Italics: Data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
[2] Between 21 February 1958 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only. Data are for the former Egyptian Region.
[3] Comprising 43.7 per cent of total population in 1958.
[4] Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.
[5] Deaths coded according to the categories of the Seventh (1955) Revision of International Statistical Classification of Diseases, Injuries and Causes of Death.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[2] 21 février 1958-29 septembre 1961: Région égyptienne et Région syrienne. A partir du 29 septembre 1961, ancienne Région égyptienne seulement. Les données se rapportent à l'ancienne Région égyptienne.
[3] L'enregistrement saisirait 43,7 pour 100 de la population totale en 1958.
[4] Y compris les résidents canadiens temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis temporairement au Canada.
[5] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.

18. Deaths by cause, age and sex (continued) — Décès selon la cause, l'âge et le sexe (suite)

Italics: Data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
[5] Deaths coded according to the categories of the Seventh (1955) Revision of International Statistical Classification of Diseases, Injuries and Causes of Death.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[5] Décès classés suivant les catégories de la Septième Revision, 1955, des Nomenclatures internationales des maladies et causes de décès.

18. Deaths by cause, age and sex (continued) — Décès selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

† Data tabulated by year of registration rather than occurrence.
[5] Deaths coded according to the categories of the Seventh (1955) Revision of International Statistical Classification of Diseases, Injuries and Causes of Death.
[7] Excluding Hawaii.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[5] Décès classés suivant les catégories de la Septième Revision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[7] Non compris Hawaii.

18. Deaths by cause, age and sex (continued) — Décès selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

Italics: Data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
[8] Data are burial permits.
[9] Some deaths from accidents appear to be included in B 46 rather than in BE 48.
[10] Excluding Indian jungle population.
[11] Data are medically certified deaths only.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[8] Les données représentent les permis d'inhumer.
[9] Il semble que certains décès dus à des accidents ont été classés dans B46 au lieu de BE48.
[10] Non compris les Indiens de la jungle.
[11] Les données représentent les certificats de décès délivrés par les médecins.

18. Deaths by cause, age and sex (continued) — Décès selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

AMERICA, SOUTH (continued), **ASIA — AMERIQUE DU SUD** (suite), **ASIE**

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[12] Excluding Indian jungle population, estimated at 350 000 in 1940.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[12] Non compris les Indiens de la jungle au nombre de 350 000 en 1940 (estimation).

18. Deaths by cause, age and sex (continued) — Décès selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

* Provisional.
† Data tabulated by year of registration rather than occurrence.
[13] Data exclude deaths of infants dying before registration of birth, deaths among armed forces and also those among foreigners.
[14] Data exclude 1 death of unknown age and sex in B45.

* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[13] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance ni les décès survenus parmi les forces armées et les étrangers.
[14] Non compris 1 décès l'âge et de sexe inconnus dans B45.

18. Deaths by cause, age and sex (continued) — Décès selon la cause, l'âge et le sexe (suite)

Italics: Data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
[16] Excluding foreigners, but including registered Palestinian refugees; for number of refugees, see Table 4. Data also include late foetal deaths.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[16] Non compris les étrangers, mais y compris les réfugiés de la Palestine immatriculés. Pour le nombre de réfugiés, voir le Tableau 4. Y compris également les morts fœtales tardives.

18. Deaths by cause, age and sex (continued) — Décès selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

A S I A (continued) — **A S I E** (suite)

Italics: Data are unreliable or of unknown completeness.

[17] Data are incomplete returns; reports were received from only 84 per cent of local civil registrars.

[18] Data exclude 2 404 male and 611 female deaths classified according to the "nature of injury" N code, i.e. alternative classification of Accidents, Poisoning and Violence.

[19] Data exclude deaths of infants dying before registration of birth and deaths among Allied military and civilian personnel and their dependants stationed in the area.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

[17] Des bulletins n'ont été reçus que de 84 pour cent seulement des bureaux d'état civil.

[18] Non compris 2 404 décès du sexe masculin et 611 du sexe féminin classés selon la "nature du traumatisme", code N: Classement des accidents, empoisonnements et traumatismes.

[19] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance et les décès survenus parmi les militaires et agents civils alliés en poste sur le territoire ni les membres de leur famille les accompagnant.

18. Deaths by cause, age and sex (continued) — Décès selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

A S I A (continued) — **A S I E** (suite)

Italics: Data are unreliable or of unknown completeness.

† Data tabulated by year of registration rather than occurrence.

[20] Data exclude 1 death of unknown age and sex in B45; also 2 deaths of unknown sex under 1 year of age, of which 1 in B44 and 1 in B45.

[21] Including 73 deaths pending Coroner's inquest, of which 59 male and 14 female.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[20] Non compris 1 décès d'âge et de sexe inconnus dans B45 ainsi que 2 décès de sexe inconnu de moins de 1 an d'âge dont 1 dans B44 et l'autre dans B45.

[21] Y compris 73 morts pendant l'enquête judiciaire par-devant jury dont 59 hommes et 14 femmes.

18. Deaths by cause, age and sex (continued) — Décès selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

[5] Deaths coded according to the categories of the Seventh (1955) Revision of International Statistical Classification of Diseases, Injuries and Causes of Death.
[23] Excludes Streptococcal sore throat (051).
[24] Other diseases of heart (430-434) included in B25 rather than in B27.
[25] Cirrhosis of liver (581) is included in B46 rather than B37.
[26] Data exclude infants born alive after less than 28 weeks' gestation, of less than 1 000 grammes in weight and 35 centimetres in length, who die within 24 hours of birth.

[5] Décès classés suivant les catégories de la Septième Revision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[23] Non compris l'angine à streptocoques.
[24] Autres maladies du cœur (430-434) classées dans B25 au lieu de B27.
[25] Cirrhose du foie (581) comprise dans B46 et non dans B37.
[26] Non compris les enfants nés vivants après moins de 28 semaines de gestation, pesant moins de 1 000 grammes, mesurant moins de 35 centimètres et décédés dans les 24 heures qui ont suivi leur naissance.

18. Deaths by cause, age and sex (continued) — Décès selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

[5] Deaths coded according to the categories of the Seventh (1955) Revision of International Statistical Classification of Diseases, Injuries and Causes of Death.

[28] Including armed forces stationed outside country.

[30] Classification by age based on difference between day, month and year of birth and death for ages under 5 years, and between year of birth and year of death for ages 5 and over. Reason for discrepancy between sum of frequencies for each age group and corresponding figure shown elsewhere appears to be that deaths at unknown age have not been distributed proportionately among those at known age.

[31] Data exclude live-born infants dying before registration of birth, numbering 2 023 males and 1 500 females.

[32] Including residents of the Federal Republic of Germany temporarily in West Berlin and excluding alien armed forces and non-resident civilians temporarily in the area.

[5] Décès classés suivant les catégories de la Septième Revision, 1955, des Nomenclatures internationales des maladies et causes de décès.

[28] Y compris les forces armées en garnison hors du pays.

[30] Le classement selon l'âge repose sur la différence entre la date exacte de la naissance et celle du décès (l'une et l'autre exprimées selon le jour, le mois et l'année) jusqu'à moins de 5 ans, et entre l'année de la naissance et celle du décès pour 5 ans et plus. L'écart relevé entre la somme des données concernant chaque groupe d'âge et le chiffre correspondant qui figure ailleurs semble dû au fait que les décès d'âge inconnu n'ont pas été proportionnellement répartis entre les groupes d'âge connu.

[31] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance, soit 2 023 du sexe masculin et 1 500 du sexe féminin.

[32] Y compris les résidents de la République fédérale d'Allemagne temporairement à Berlin-Ouest, mais non compris les militaires étrangers et les civils non résidents temporairement à Berlin-Ouest.

18. Deaths by cause, age and sex (continued) — Décès selon la cause, l'âge et le sexe (suite)

† Data tabulated by year of registration rather than occurrence.
[5] Deaths coded according to the categories of the Seventh (1955) Revision of International Statistical Classification of Diseases, Injuries and Causes of Death.
[33] Data are deaths registered within one year of occurrence.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[5] Décès classés suivant les catégories de la Septième Revision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[33] Les données représentent les décès enregistrés dans l'année de l'événement.

18. Deaths by cause, age and sex (continued) — Décès selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

[5] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death.
[35] Including residents outside country if listed in a Netherlands population register, but excluding alien armed forces stationed in the area.
[36] Including Norwegian residents temporarily outside country.

[5] Décès classés suivant les catégories de la Septième Revision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[35] Y compris les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais, mais non compris les militaires étrangers en garnison sur le territoire.
[36] Y compris les résidents norvégiens temporairement hors du pays.

18. Deaths by cause, age and sex (continued) — Décès selon la cause, l'âge et le sexe (suite)

[5] Deaths coded according to the categories of the Seventh (1955) Revision of International Statistical Classification of Diseases, Injuries and Causes of Death.

[37] Data exclude infants dying within 24 hours of birth, numbering 2 434 males and 1 626 females.

[5] Décès classés suivant les catégories de la Septième Revision, 1955, des Nomenclatures internationales des maladies et causes de décès.

[37] Non compris les enfants décédés dans les 24 heures qui ont suivi leur naissance, soit 2 434 pour le sexe masculin et 1 626 pour le sexe féminin.

18. Deaths by cause, age and sex (continued) — Décès selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

* Provisional.
† Data tabulated by year of registration rather than occurrence.
[5] Deaths coded according to the categories of the Seventh (1955) Revision of International Statistical Classification of Diseases, Injuries and Causes of Death.
[38] Excluding full-blooded aborigines, estimated at 39 319 in June 1954.

* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[5] Décès classés suivant les catégories de la Septième Revision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[38] Non compris les aborigènes purs, au nombre de 39 319 en juin 1954.

18. Deaths by cause, age and sex (continued) — Décès selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

† Data tabulated by year of registration rather than occurrence.

[5] Deaths coded according to the categories of the Seventh (1955) Revision of International Statistical Classification of Diseases, Injuries and Causes of Death.

[39] Excluding alien armed forces stationed in the area.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[5] Décès classés suivant les catégories de la Septième Revision, 1955, des Nomenclatures internationales des maladies et causes de décès.

[39] Non compris les militaires étrangers en garnison sur le territoire.

19. Death rates by cause, specific for age and sex : latest available year
Taux de mortalité selon la cause, l'âge et le sexe : dernière année disponible

[Rates are the number of deaths of persons of specified age and sex per 100 000 population of the same age and sex, except for infants under 1 year of age, for which rates are deaths per 100 000 live births of the same sex. Data exclude foetal deaths. Unless otherwise noted, cause of death is classified according to List B, the Abbreviated List of 50 Causes for Tabulation of Mortality, of the Sixth (1948) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death. For full titles of cause groups and Detailed List categories included, see Table 17. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 37. — Les taux représentent le nombre des décès de personnes d'âge et de sexe donnés pour 100 000 personnes du même âge et du même sexe dans la population totale; toutefois, pour les enfants de moins de 1 an, les taux représentent le nombre des décès pour 100 000 naissances vivantes du même sexe. Il n'est pas tenu compte des morts fœtales. Sauf indication contraire, les causes de décès sont classées conformément à la Liste B — Liste abrégée de 50 rubriques pour la mise en tableaux des causes de mortalité — de la Sixième Revision (1948) du Classement statistique international des maladies, traumatismes et causes de décès. Pour la désignation complète des groupes de causes et les catégories de la Liste détaillée comprises dans ces groupes, voir le tableau 17.

Les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et les insuffisances des données, voir Notes Techniques, page 89.]

* Provisional.
† Rates known to refer to year of registration rather than occurrence.
[1] Includes unknown age.
[2] Prior to 31 May 1961, known as Union of South Africa.

* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[2] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table — Voir note au début du tableau.]

* Provisional.
[1] Includes unknown age.
[2] Prior to 31 May 1961, known as Union of South Africa.

* Données provisoires.
[1] Y compris les décès d'âge inconnu.
[2] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table — Voir note au début du tableau.]

[1] Includes unknown age.
[3] Including Canadian residents temporarily in the United States, but excluding United States residents temporarily in Canada.
[4] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death.
[5] Rates for deaths under 1 year of age computed on live births tabulated by year of registration rather than occurrence.

[1] Y compris les décès d'âge inconnu.
[3] Y compris les résidents canadiens se trouvant temporairement aux Etats-Unis, mais non compris les résidents des Etats-Unis se trouvant temporairement au Canada.
[4] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[5] Pour les décès de moins de 1 an, taux calculés sur la base du chiffre des naissances vivantes exploitées selon l'année de l'enregistrement et non celle de l'événement.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table — Voir note au début du tableau.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Rates known to refer to year of registration rather than occurrence.
[1] Includes unknown age.
[4] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death.
[6] Excluding data for Canal Zone; also excluding tribal Indian population, numbering *60 540.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[4] Décès classés suivant les catégories de la Septième Revision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[6] Non compris la Zone du Canal et les Indiens vivant en tribus, au nombre de *60 540.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table — Voir note au début du tableau.]

AMERICA, NORTH (continued) — **AMERIQUE DU NORD** (suite)

† Rates known to refer to year of registration rather than occurrence.
[1] Includes unknown age.
[4] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death.
[7] Excluding Hawaii.
[8] Rates for deaths under 1 year of age computed on births estimated from a 50 per cent sample.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[4] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[7] Non compris Hawaii.
[8] Pour les décès de moins de 1 an, taux calculés sur la base des statistiques des naissances estimées à partir d'un échantillon de 50 pour 100.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

* Provisional.
[1] Includes unknown age.
[9] Rates exclude deaths of infants dying before registration of birth, deaths among armed forces and also those among foreigners.

* Données provisoires.
[1] Y compris les décès d'âge inconnu.
[9] Non compris les enfants décédés avant l'enregistrement de leur naissance, les décès survenus parmi les militaires et parmi les étrangers.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

† Rates known to refer to year of registration rather than occurrence.
[1] Includes unknown age.
[10] Rates are for Japanese nationals in Japan only and exclude 27 deaths of unknown age and sex in BE48.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[10] Les données ne concernent que les nationaux japonais se trouvant au Japon. Non compris 27 décès d'âge et de sexe inconnus classés dans BE48.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

Italics: Data are unreliable or of unknown completeness.
† Rates known to refer to year of registration rather than occurrence.
[1] Includes unknown age.
[11] Rates based on reports received from only 84 per cent of local civil registrars but computed on total population.
[12] Rates exclude 2 404 male and 611 female deaths classified according to the "nature of injury" N code, i.e. alternative classification of Accidents, Poisoning and Violence.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[11] Taux calculés d'après les bulletins reçus de 84 pour 100 seulement des bureaux d'état civil, les données recueillies étant rapportées au chiffre de la population totale.
[12] Non compris 2 404 décès du sexe masculin et 611 du sexe féminin classés selon la "nature du traumatisme", code N: Classement des accidents, empoisonnements et traumatismes.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

[1] Includes unknown age.
[13] Rates exclude deaths of infants dying before registration of birth, and deaths among Allied military and civilian personnel and their dependents stationed in the area.

[1] Y compris les décès d'âge inconnu.
[13] Non compris les enfants décédés avant l'enregistrement de leur naissance, ni les décès survenus parmi les militaires et civils alliés en poste sur le territoire et les membres de leur famille les accompagnant.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

[1] Includes unknown age.
[14] Including armed forces stationed outside country but excluding alien armed forces stationed in the area.
[15] Excludes Streptococcal sore throat (051).
[16] Other diseases of heart (430-434) included in B25 rather than in B27.
[17] Cirrhosis of liver (581) is included in B46 rather than B37.

[1] Y compris les décès d'âge inconnu.
[14] Y compris les militaires nationaux hors du pays, mais non compris les militaires étrangers en garnison sur le territoire.
[15] Non compris l'angine à streptocoques.
[16] Autres maladies du cœur (430-434) classées dans B25 et non dans B27.
[17] Cirrhose du foie classée dans B46 et non dans B37.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[1] Includes unknown age.
[4] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death.
[18] Rates (for all ages and under one year) exclude infants born alive after less than 28 weeks' gestation, of less than 1 000 grammes in weight and 35 centimetres in length, who die within 24 hours of birth.
[19] Excluding Faeroe Islands and Greenland. Including armed forces stationed outside country.

[1] Y compris les décès d'âge inconnu.
[4] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[18] Les taux (pour tous les âges et moins de 1 an) ne comprennent pas les enfants nés vivants après moins de 28 semaines de gestation, pesant moins de 1 000 grammes, mesurant moins de 35 centimètres et décédés dans les 24 heures qui ont suivi leur naissance.
[19] Non compris les îles Féroé et le Groenland. Y compris les militaires en garnison hors du pays.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

[1] Includes unknown age.

[4] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death.

[20] Including nationals temporarily outside country.

[21] Rates include deaths among armed forces outside country but are computed on population including an allowance for residents temporarily outside country (comprising principally young men on military duty), who in 1954 were estimated at 187 000.

[22] Rates exclude live-born infants dying before registration of birth, numbering 2 023 males and 1 500 females.

[23] Classification by age based on difference betwen day, month and year of birth and death for ages under 5 years, and between year of birth and year of death for ages 5 and over.

[1] Y compris les décès d'âge inconnu.

[4] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.

[20] Y compris les nationaux temporairement hors du pays.

[21] Pour le calcul des taux, le nombre des décès survenus dans la population, y compris les militaires hors du pays, est rapporté à un chiffre de population qui tient compte des nationaux résident temporairement à l'étranger (principalement les militaires du contingent), soit 187 000 personnes en 1954 (estimation).

[22] Non compris les enfants nés vivants décédés avant l'enregistrement de leur naissance, au nombre de 2 023 pour le sexe masculin et 1 500 pour le sexe féminin.

[23] Le classement selon l'âge repose sur la différence entre la date exacte de la naissance et celle du décès (l'une et l'autre exprimées selon le jour, le mois et l'année) jusqu'à moins de 5 ans, et entre l'année de la naissance et celle du décès pour 5 ans et plus.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

[1] Includes unknown age.
[4] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death.
[24] Including residents of the Federal Republic of Germany temporarily in West Berlin, and excluding alien armed forces and non-resident civilians temporarily in the area.

[1] Y compris les décès d'âge inconnu.
[4] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[24] Y compris les résidents de la République fédérale d'Allemagne temporairement à Berlin-Ouest, mais non compris les militaires étrangers et les civils non résidents se trouvant temporairement sur le territoire.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

* Provisional.
[1] Includes unknown age.
[25] Infant mortality rates are provisional, having been computed on provisional total of live births.

* Données provisoires.
[1] Y compris les décès d'âge inconnu.
[25] Les taux de mortalité infantile ayant été calculés sur la base du nombre total provisoire des naissances vivantes sont eux-mêmes provisoires.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

* Provisional.
[1] Includes unknown age.
[26] Rates include deaths among armed forces stationed outside country and exclude those among non-Maltese armed forces in the area, but are computed on population excluding non-Maltese armed forces stationed in the area and including civilian nationals temporarily outside country.

* Données provisoires.
[1] Y compris les décès d'âge inconnu.
[26] Y compris les décès de militaires nationaux survenus hors du pays, mais non compris les décès de militaires non maltais en garnison sur le territoire. Les taux sont calculés sur la base d'un chiffre de population qui ne comprend pas les militaires non maltais en garnison sur le territoire, mais qui comprend les ressortissants civils temporairement hors du pays.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

EUROPE (continued — suite)

[1] Includes unknown age.
[4] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death.
[27] Including residents outside country if listed in a Netherlands population register, but excluding alien armed forces stationed in the area.
[28] Including Norwegian residents temporarily outside country.

[1] Y compris les décès d'âge inconnu.
[4] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[27] Y compris les résidents hors du pays s'ils sont inscrits sur un registre de population néerlandais, mais non compris les militaires étrangers en garnison sur le territoire.
[28] Y compris les résidents norvégiens temporairement hors du pays.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

† Rates known to refer to year of registration rather than occurrence.
[1] Includes unknown age.
[4] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[4] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

* Provisional.
† Rates known to refer to year of registration rather than occurrence.
[1] Includes unknown age.
[4] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death.
[29] Excluding full-blooded aborigines, estimated at 39 319 in June 1954.

* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[4] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[29] Non compris les aborigènes purs, au nombre de 39 319 en juin 1954.

19. Death rates by cause, specific for age and sex (continued) — Taux de mortalité selon la cause, l'âge et le sexe (suite)

[See note at head of table. — Voir note au début du tableau.]

OCEANIA (continued) — **OCEANIE** (suite)

† Rates known to refer to year of registration rather than occurrence.
[1] Includes unknown age.
[4] Deaths coded according to the categories of the Seventh (1955) Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death.
[30] Excluding alien armed forces stationed in the area.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Y compris les décès d'âge inconnu.
[4] Décès classés suivant les catégories de la Septième Révision, 1955, des Nomenclatures internationales des maladies et causes de décès.
[30] Non compris les militaires étrangers en garnison sur le territoire.

20. Deaths by marital status, age and sex : latest available year

[Data exclude foetal deaths. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, p. 37.]

[4] Northern part of former Spanish Protectorate.
[5] Data exclude deaths of infants dying within 24 hours of birth.
[6] Prior to 31 May 1961, known as Union of South Africa.
[7] Marital status not classified by age shown at end of table.
[8] Excluding Consensually married; see category below.

[4] Partie nord de l'ancien protectorat espagnol.
[5] Non compris les enfants décédés dans les 24 heures qui ont suivi la naissance.
[6] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.
[7] Les données sur les décès sont réparties selon l'état matrimonial mais non selon l'âge; on les trouvera à la fin du tableau.
[8] Non compris les personnes vivant en union consensuelle (voir plus bas).

[16] Deaths of persons whose marriages were annulled are included with Divorced rather than Single.
[17] Including armed forces stationed outside country but excluding alien armed forces stationed in the area.
[18] Excluding Faeroe Islands and Greenland.
[19] Including armed forces stationed outside country.
[20] Including nationals temporarily outside country.

[16] Les décès de personnes dont le mariage a été annulé sont classés parmi ceux des "divorcés" et non ceux des "célibataires".
[17] Y compris les militaires nationaux du pays, mais non compris les militaires étrangers en garnison sur le territoire.
[18] Non compris les îles Féroé et le Groenland.
[19] Y compris les militaires hors du pays.
[20] Y compris les nationaux temporairement hors du pays.

Italics: Data are unreliable or of unknown completeness.

[7] Marital status not classified by age shown at end of table.

[19] Including armed forces stationed outside country.

[21] Classification by age based on difference between year of birth and year of death.

[22] Including data for East Berlin.

[23] Including residents of the Federal Republic of Germany temporarily in West Berlin and excluding alien armed forces and non-resident civilians temporarily in the area.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

[7] Les données sur les décès sont réparties selon l'état matrimonial mais non selon l'âge; on les trouvera à la fin du tableau.

[19] Y compris les militaires hors du pays.

[21] Le classement selon l'âge repose sur la différence entre l'année de la naissance et celle du décès.

[22] Y compris Berlin-Est.

[23] Y compris les résidents de la République fédérale d'Allemagne se trouvant temporairement dans Berlin-Ouest, mais non compris les membres des familles des militaires étrangers et des civils non résidents se trouvant temporairement dans la République fédérale d'Allemagne.

20. Décès selon l'état matrimonial, l'âge et le sexe (suite)

[Voir note au début du tableau.]

[24] Including residents of West Berlin temporarily in the Federal Republic of Germany and excluding alien armed forces and non-resident civilians temporarily in the area.

[25] Marital status not classified by age for 1960 shown at end of table.

[26] Data exclude deaths of residents outside country, numbering 66 males and 25 females.

[24] Y compris les résidents de Berlin-Ouest se trouvant temporairement dans la République fédérale d'Allemagne, mais non compris les membres des familles des militaires étrangers et des civils non résidents se trouvant temporairement dans Berlin-Ouest.

[25] 1960: les données sur les décès sont réparties selon l'état matrimonial, mais non selon l'âge; on les trouvera à la fin du tableau.

[26] Non compris les résidents se trouvant hors du pays, soit 66 pour le sexe masculin et 25 pour le sexe féminin.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[2] Excluding armed forces.
[5] Data exclude deaths of infants dying within 24 hours of birth.
[24] Including residents of West Berlin temporarily in the Federal Republic of Germany and excluding alien armed forces and non-resident civilians temporarily in the area.
[31] Data are deaths at ages 15 years and over.
[32] Data are estimates based on experience of 1952-1954.
[33] Including residents outside country if listed in a Netherlands population register but excluding alien armed forces stationed in the area. Excluding Amboynese living in camps.
[34] Excluding Indian jungle population, estimated at 350 000 in 1940.
[35] Data are deaths of males 17 years of age and over and females 15 years of age and over.
[36] Between 21 February 1956 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only. Data are for the former Egyptian Region.
[37] Data are for localities having Health Bureaux, which comprised 43.7 per cent of total population in 1958.
[38] Excluding Indian jungle population, numbering 56 705 in 1950 and estimated at 31 800 in 1961.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[2] Non compris les forces armées.
[5] Non compris les enfants décédés dans les 24 heures qui ont suivi la naissance.
[24] Y compris les résidents de Berlin-Ouest se trouvant temporairement dans la République fédérale d'Allemagne, mais non compris les membres des familles des militaires étrangers et des civils non résidents se trouvant temporairement dans Berlin-Ouest.
[31] Décès de personnes âgées de 15 ans et plus seulement.
[32] Estimations établies sur la base de données concernant la période 1952-1954.
[33] Y compris les résidents hors du territoire s'ils sont inscrits sur un registre de population néerlandais, mais non compris les militaires étrangers en garnison sur le territoire. Non compris les Amboinais vivant dans des camps.
[34] Non compris les Indiens de la jungle, au nombre de 350 000 en 1940 (estimation).
[35] Sexe masculin: décès de personnes âgées de 17 ans et plus; sexe féminin: décès de personnes âgées de 15 ans et plus.
[36] 21 février 1956—29 septembre 1961: Région égyptienne et Région syrienne. A partir du 29 septembre 1961, ancienne Région égyptienne seulement. Données se rapportant à l'ancienne Région égyptienne.
[37] Données concernant les localités dotées d'un bureau d'hygiène, qui comprenaient 43,7 pour 100 de la population totale en 1958.
[38] Non compris les Indiens de la jungle, au nombre de 56 705 en 1950 et 31 800 en 1961 (estimation).

21. Death rates specific for marital status, age and sex : latest available year

[Rates are the number of deaths in each age-sex-marital status group per 1 000 population of the same age, sex and marital status. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 38.]

[14] For 15 years of age and over.
[17] Rates computed on population actually enumerated 25 April 1952, i.e., excluding 5.8 per cent adjustment for underenumeration.
[18] Consensually married included with Single rather than Married.
[19] Rates based on deaths of Japanese nationals in Japan only but computed on total population.

† Données se rapportant à l'année d'enregistrement et non à l'année de l'événement.
[1] Y compris le groupe d'âge inconnu; l'ensemble des états matrimoniaux comprend les chiffres de la catégorie "état matrimonial inconnu".
[5] Les taux sont établis sur la base des décès répartis selon l'état matrimonial, mais non selon l'âge; on les trouvera à la fin du tableau.
[14] 15 ans et plus.
[17] Taux calculés sur la base de la population effectivement dénombrée le 25 avril 1952, c'est-à-dire compte non tenu d'un ajustement de 5,8 pour 100 pour sous-dénombrement.
[18] Les personnes en union consensuelle sont classées avec les Célibataires et non avec les Mariés.
[19] Taux calculés en rapportant le nombre des décès de nationaux japonais se trouvant au Japon au chiffre total de la population.

21. Taux de mortalité selon l'état matrimonial, l'âge et le sexe (suite)

[20] Excluding Faeroe Islands and Greenland. Including armed forces stationed outside country.

[21] Rates differ slightly from corresponding rates shown elsewhere because computed on mean of 1 January population estimates rather than midyear.

[22] Including nationals temporarily outside country.

[23] Rates based on deaths including armed forces outside country but computed on population including an allowance for residents temporarily outside country (comprising principally young men on military duty), who in 1954 were estimated at 187 000.

[24] Classification by age based on difference between year of birth and year of death.

[20] Non compris les îles Féroé et l Groenland. Y compris les militaires hors du pays.

[21] Ces taux diffèrent légèrement des taux correspondants indiqués ailleurs, car ils ont été calculés sur la base d'estimations moyennes de la population au 1er janvier et non au milieu de l'année.

[22] Y compris les nationaux temporairement hors du pays.

[23] Taux calculés en rapportant le nombre des décès (y compris ceux qui sont survenus parmi les militaires hors du pays) à un chiffre de population ajusté pour tenir compte des résidents temporairement hors du pays (principalement les militaires du contingent), qui en 1954 étaient au nombre de 187 000 (estimation).

[24] Le classement selon l'âge repose sur la différence entre l'année de la naissance et celle du décès.

* Provisional.
[1] Includes unknown age; "All conditions" also includes unknown marital status.
[5] Rates by marital status not classified by age shown at end of table.
[25] Including residents of the Federal Republic of Germany temporarily in West Berlin and excluding alien armed forces and non-resident civilians temporarily in the area.
[26] Rates computed on mean population for which marital status classification is based on results of 1 per cent sample survey of all households (microcensus) taken in October 1958 and 1959.
[27] Including residents of West Berlin temporarily in the Federal Republic of Germany and excluding alien armed forces and non-resident civilians temporarily in the area.

* Données provisoires.
[1] Y compris le groupe d'âge inconnu; l'ensemble des états matrimoniaux comprend les chiffres de la catégorie "état matrimonial inconnu".
[5] Les taux sont établis sur la base des décès répartis selon l'état matrimonial, mais non selon l'âge; on les trouvera à la fin du tableau.
[25] Y compris les résidents de la République fédérale d'Allemagne se trouvant temporairement dans Berlin-Ouest, mais non compris les membres des familles des militaires étrangers et des civils non résidents se trouvant temporairement dans la République fédérale d'Allemagne.
[26] Taux calculés sur la base d'un chiffre moyen de la population; le classement selon la situation matrimoniale a été établi d'après les résultats d'une enquête par sondage ayant porté sur 1 pour 100 des ménages (micro-recensement) et effectuée en octobre 1958 et 1959.
[27] Y compris les résidents de Berlin-Ouest se trouvant temporairement dans la République fédérale d'Allemagne, mais non compris les membres des familles des militaires étrangers et des civils non résidents se trouvant temporairement dans Berlin-Ouest.

[28] Marital status not classified by age for 1960 shown at end of table.
[29] Rates computed on population based on 1 per cent representative sample of census returns and for which Consensually married persons are tabulated according to their legal status.
[30] Deaths of persons 80 years of age and over of unknown marital status, numbering 11 males and 17 females, included in All conditions; not available separately.
[31] Excluding that part of the former Free Territory of Trieste incorporated in 1954.
[32] Including Norwegian residents temporarily outside country.
[33] Rates differ slightly from corresponding rates shown elsewhere because computed on end-year estimated population rather than on midyear.

[28] 1960: les données sur les décès sont réparties selon l'état matrimonial, mais non selon l'âge; on les trouvera à la fin du tableau.
[29] Taux calculés d'après un chiffre de population établi sur la base d'un échantillon représentatif de 1 pour 100 des bulletins de recensement; les personnes en union consensuelle ont été classées d'après leur situation juridique.
[30] Les décès de personnes de 80 ans et plus dont l'état matrimonial est inconnu (soit 11 pour le sexe masculin et 17 pour le sexe féminin) sont compris dans le chiffre concernant l'ensemble des états matrimoniaux; leur répartition n'est pas connue.
[31] Non compris la partie de l'ancien territoire libre de Trieste attribuée à l'Italie en 1954.
[32] Non compris les résidents norvégiens temporairement hors du pays.
[33] Ces taux diffèrent légèrement des taux correspondants indiqués ailleurs, car ils sont calculés sur la base de la population estimée en fin d'année et non au milieu de l'année.

[34] Rates computed on population including armed forces stationed outside country but excluding other Commonwealth and alien armed forces stationed in the area.

[34a] One male and one female death, but corresponding population given as zero.

[35] Excluding full-blooded aborigines, estimated at 39 319 in June 1954.

[36] Excluding alien armed forces stationed in the area.

[34] Taux calculés sur la base d'un chiffre de population qui comprend les militaires hors du pays mais non les militaires du Commonwealth ni les militaires étrangers dans le pays.

[34a] Il n'a été enregistré que deux décès dont 1 du sexe masculin et 1 du sexe féminin toutefois la population relative à ces deux groupes est donnée comme étant zéro.

[35] Non compris les aborigènes purs, au nombre de 39 319 en juin 1954 (estimation).

[36] Non compris les militaires étrangers en garnison sur le territoire.

21. Death rates specific for marital status, age and sex (continued)

[See note at head of table.]

Data given below are available only by marital status and sex — Pour les données ci-après, seule la répartition selon l'état matrimonial et le sexe est connue

Country, year and sex Pays, année et sexe			Marital status — Etat matrimonial				
			All conditions [37] Ensemble [37]	Single Célibataires	Married Mariés	Widowed Veufs	Divorced Divorcés

Italics: Data are unreliable or of unknown completeness.

† Data known to refer to year of registration rather than occurrence.

[4] Rates exclude deaths of infants dying before registration of birth.

[27] Including residents of West Berlin temporarily in the Federal Republic of Germany and excluding alien armed forces and non-resident civilians temporarily in the area.

[37] Including unknown marital status.

[38] Rates based on population 15 years of age and over but computed on population 14 years of age and over.

[39] Rates computed on population actually enumerated, i.e., excluding 1 per cent adjustment for underenumeration.

[40] Computed on population including Divorced.

[41] Excludes deaths for Annulled.

[42] Computed on population excluding Separated.

[43] Based on deaths including Annulled and computed on population including Separated.

[44] Rates based on burial permits; computed on population excluding adjustment for underenumeration, estimated at 191 683, and indigenous population, numbering 127 980.

[45] Based on deaths including 15 307 persons "under puberty".

[46] Differs slightly from corresponding rates shown elsewhere because computed on population estimated as of 31 December 1959 rather than midyear.

[47] Computed on population which includes Consensually married with Single rather than Married.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

† Données se rapportant à l'année d'enregistrement et non à l'année de l'événement.

[4] Non compris les enfants décédés dans les 24 heures qui ont suivi la naissance.

[27] Y compris les résidents de Berlin-Ouest se trouvant temporairement dans la République fédérale d'Allemagne, mais non compris les membres des familles des militaires étrangers et des civils non résidents se trouvant temporairement dans Berlin-Ouest.

[37] Y compris les personnes dont l'état matrimonial est inconnu.

[38] Taux basés sur un chiffre de population comprenant les personnes âgées de 15 ans et plus; toutefois les taux ont été calculés sur un chiffre de population comprenant les personnes âgées de 14 ans et plus.

[39] Taux calculés sur la base de la population effectivement dénombrée, c'est-à-dire compte non tenu d'un ajustement de 1 pour 100 pour sous-dénombrement.

[40] Taux calculé sur la base d'un chiffre de population comprenant les Divorcés.

[41] Non compris les décès des personnes dont le mariage a été annulé.

[42] Taux calculé sur la base d'un chiffre de population ne comprenant pas les Séparés.

[43] Taux calculé en rapportant le nombre des décès, y compris ceux des personnes dont le mariage a été annulé, à un chiffre de population comprenant les Séparés.

[44] Taux calculés en rapportant le nombre des permis d'inhumer délivrés à un chiffre de population qui ne tient pas compte d'un ajustement pour sous-dénombrement, estimé à 191 683, et qui ne comprend pas les indigènes, au nombre de 127 980.

[45] Taux calculé d'après un chiffre des décès comprenant ceux de 15 307 "impubères".

[46] Ce taux diffère légèrement des taux indiqués ailleurs, car il est calculé sur la base d'une estimation de la population au 31 décembre 1959 et non au milieu de l'année.

[47] Taux calculés sur la base d'un chiffre de population comprenant les personnes en union consensuelle classées avec les Célibataires et non avec les Mariés.

21. Taux de mortalité selon l'état matrimonial, l'âge et le sexe (suite)

[Voir note au début du tableau.]

	Members of the armed forces — Membres des forces armées	76	–	–	2	3	2	11	25	33	–

[6] Reason for discrepancy between this and corresponding figure shown elsewhere not ascertained.

[16] Excluding male deaths of students, home houseworkers, etc., numbering 86 in 1958 and 69 in 1959; of pensioners and persons with independent income, numbering 81 874 in 1957 and 88 087 in 1958; and of persons with unknown occupation, numbering 153 in 1957 and 25 in 1959.

[17] Including armed forces stationed outside country and excluding non-Maltese armed forces in the area.

[6] On ne sait pas comment s'explique la divergence entre ce chiffre et le chiffre correspondant indiqué ailleurs.

[16] Non compris les décès d'étudiants, travailleurs au foyer, etc., au nombre de 86 en 1958 et de 69 en 1959; de retraités et de titulaires de revenus indépendants, au nombre de 81 874 en 1957 et de 88 087 en 1958, et de personnes de profession inconnue, au nombre de 153 en 1957 et de 25 en 1959.

[17] Y compris les militaires en garnison hors du pays, mais non compris les militaires non maltais en garnison sur le territoire.

22. Male deaths by occupation and age (continued) — Décès selon la profession et l'âge (sexe masculin) [suite]

23. Male death rates specific for occupation and age : latest available year
Taux de mortalité selon la profession et l'âge (sexe masculin) : dernière année disponible

[Unless otherwise specified, occupation is classified in accordance with the major groups of the International Standard Classification of Occupations (ISCO). Rates are deaths of males in each occupation-age group per 100 000 population of the same occupation, age and sex and have not been computed by the Statistical Office of the United Nations. For method of evaluation and limitations of data, see Technical Notes, page 40. — Sauf indication contraire, les professions sont réparties sur la base des grands groupes de la Classification internationale type des professions (CITP). Les taux représentent le nombre des décès de personnes du sexe masculin et de professions et d'âge indiqués pour 100 000 personnes de même profession, âge et sexe. Les calculs n'ont pas été faits au Bureau de statistique des Nations Unies. Pour la méthode d'évaluation et les insuffisances des données, voir Notes Techniques, page 93.]

[1] Rates are for Japanese nationals in Japan only and are deaths of employed males. Deaths are annual averages for the period 1954-1956; rates are computed on the corresponding age and occupation-group of one per cent sample of 1955 population census.

[2] "Self-defense forces" included with Group 9 rather than with Members of the armed forces.

[3] Occupational classification is national and refers to selected socio-professional categories which are not mutually exclusive.

[1] Ne concerne que les nationaux japonais se trouvant au Japon et les décès de personnes du sexe masculin occupant un emploi. Les taux sont calculés sur la base du nombre moyen des décès annuels survenus au cours de la période 1954-1956 dans un échantillon de 1 pour 100 de la population de 1955, classée selon les groupes d'âge et de profession correspondants.

[2] Les hommes des forces d'autodéfense sont classés dans le groupe 9 et non parmi les membres des forces armées.

[3] Classification nationale établie selon certaines catégories socio-professionnelles qui peuvent fort bien chevaucher.

23. Male death rates specific for occupation and age (continued)— Taux de mortalité selon la profession et l'âge (sexe masculin) [suite]

[4] Data by age not available. Rates based on deaths of all ages for 1959 according to ISCO classification groups (see Japan above for details of group coverage) and computed on corresponding population from the 1957 census are as follows: Group (0) 1 260; (1-2) 1 060; (3) 890; (4) 1 650; (5) 90; (6) 700; (7-8) 1 500; (9) 970; Members of the armed forces, 940.

[5] Classification is national and refers to socio-economic groups rather than to occupation.

[6] Excluding deaths of retired males, which are distributed by previous occupation.

[4] Les données par âge ne sont pas disponibles. Pour les décès de tous âges de l'année 1959, les taux concernant les groupes de la CITP (voir Japon pour la composition détaillée des groupes) et calculés sur la base des groupes correspondant de la population dénombrée lors du recensement de 1957 s'établissent comme suit: groupes (0) 1 260; (1-2) 1 060; (3) 890; (4) 1 650; (5) 90; (6) 700; (7-8) 1 500; (9) 970; membres des forces armées, 940.

[5] Classification nationale établie selon des groupes socio-économiques et non selon la profession.

[6] Non compris les décès de retraités, qui ont été répartis selon la profession antérieure.

24. Expectation of life at specified ages for each sex : 1940–1960

[Average number of years of life remaining to persons surviving to exact age specified, if subject to mortality conditions of period indicated. For limitations of data see Technical Notes, page 41.]

[1] For non-civilized population, i.e., African population, which, not having fulfilled certain conditions established by law, is deemed to be living according to tribal customs (cf. Table 15).
[2] For Centre Oubangui, based on results of 1959 sample survey of mortality in 167 clusters of villages and one urban centre.
[3] Data based on results of a sample survey of mortality among about 3.6 per cent of indigenous population, except for ages 70 and over, which are estimated.
[4] For African population only.
[5] Data based on results of 1955 sample survey of mortality among residents.
[6] Data based on results of a sample survey of mortality between October 1957 and April 1958 in 69 villages.
[7] For Vallée du Niger, based on results of 1957-1958 sample survey of mortality in 79 rural villages and 3 urban centres.

[1] La population africaine, qui ne remplit pas certaines conditions fixées par la loi (voir tableau 15), est censée vivre selon des coutumes tribales.
[2] Centre Oubangui; données établies à partir des résultats d'une enquête par sondage sur 167 grappes de villages et un centre urbain.
[3] Données établies à partir des résultats d'une enquête par sondage ayant porté sur un échantillon de 3,6 pour 100 de la population africaine. Le nombre de survivants a 70 ans a été calculé à partir de quotients de mortalité établis par estimation.
[4] Pour la population africaine seulement.
[5] Données établies à partir des résultats d'une enquête par sondage sur la mortalité (1955) ayant porté sur les résidents.
[6] Données établies à partir des résultats de l'enquête par sondage sur la mortalité effectuée en octobre 1957 et avril 1958 dans 69 villages.
[7] Vallée du Niger; ce taux a été obtenu à partir des résultats de l'enquête par sondage sur la mortalité effectués en 1957-1958 dans 79 villages ruraux et 3 centres urbains.

24. Espérance de vie à un âge donné pour chaque sexe : 1940–1960

[Nombre moyen d'années qui restent à vivre aux personnes atteignant l'âge donné si elles sont soumises aux conditions de mortalité de la période indiquée. Pour les insuffisances des données, voir Notes Techniques, page 94.]

[8] Based on results of 1950 sample survey of mortality among indigenous African population.
[9] Based on results of 1948 sample survey of mortality among African population.
[10] Based on results of 1953-1955 sample survey of mortality among indigenous African population in villages.
[11] For Basse Vallée (population estimated at 250 000), based on results of 1957-1958 sample survey of mortality in 77 rural villages and 5 urban centres.
[12] Data are estimates, based on results of 1960 population census.
[13] Prior to 31 May 1961, known as Union of South Africa.

[8] Donnée établie à partir des résultats d'une enquête par sondage sur la mortalité (1950) ayant porté sur la population indigène africaine.
[9] Donnée établie à partir des résultats d'une enquête par sondage sur la mortalité (1948) ayant porté sur la population africaine.
[10] Donnée établie à partir des résultats d'une enquête par sondage sur la mortalité (1953-1955) ayant porté sur la population indigène africaine dans les villages.
[11] Basse Vallée (estimée à 250 000 habitants); ce taux a été obtenu à partir des résultats de l'enquête par sondage sur la mortalité (1957-1958) dans 77 villages ruraux et 5 centres urbains.
[12] Estimations établies à partir des résultats du recensement de la population, effectué en 1960.
[13] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.

* Provisional.

[13] Prior to 31 May 1961, known as Union of South Africa.

[14] Estimate for Afro-Arab population, based on results of 1958 population census.

[15] Data for ages 1, 2, 3 and 4 years based on mortality rates computed on population assumed to have same age distribution as Jamaica, 1946.

[16] Prior to 1950, excluding Yukon, Northwest Territories and Newfoundland.

* Provisoire.

[13] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.

[14] Population africano-arabe; estimation établie à partir des résultats du recensement de la population effectué en 1958.

[15] Pour 1, 2, 3 et 4 ans, les données ont été calculées à partir de quotients de mortalité pour une population qui est censée avoir la même structure par âge que celle de la Jamaïque en 1946.

[16] Sauf pour 1950, non compris le Yukon, les Territoires du Nord-Ouest et Terre-Neuve.

[17] Similarity in mortality and advantages of greater stability in larger numbers led to decision to compile life tables on combined experience.

[18] Data based on mortality rates implied from apparent survivorship rates between census of 1950 and an estimate for 1951 which was constructed on an assumed rate of growth.

[19] Excluding data for Canal Zone; also excluding tribal Indian population, numbering 55 987 in 1940, 48 654 in 1950 and 60 540 in 1960.

[17] La mortalité étant comparable dans les deux îles et les grands nombres offrant l'avantage d'une plus grande stabilité, on a décidé de dresser la table de mortalité pour l'ensemble des deux îles.

[18] Données calculées à partir de quotients de mortalité reposant sur les taux de survies apparents pour la population recensée en 1950 et la population de 1951 estimée sur la base d'un taux d'accroissement théorique.

[19] Non compris la zone du Canal; non compris également les Indiens vivant en tribus, au nombre de 55 987 en 1940, de 48 654 en 1950 et de 60 540 en 1960.

24. Expectation of life (continued)

[See note at head of table.]

[20] Data compiled by Puerto Rico Bureau of Demographic Registry and Statistics.

[21] Excluding Hawaii and prior to 1959, excluding Alaska.

[22] Data for ages under 5 years derived from mortality rates estimated on the basis of data for Trinidad and Tobago.

[20] Données établies par le *Puerto Rico Bureau of Demographic Registry and Statistics.*

[21] Non compris Hawaii et, antérieurement à 1959, l'Alaska.

[22] Moins de 5 ans: données calculées à partir de quotients de mortalité établis par estimation sur la base des statistiques concernant la Trinité et Tobago.

[24] Data are for population born in Brazil and are based on mortality rates implied from apparent survivorship rates between censuses.
[25] Excluding Amerindians, numbering 16 322 at 1946 census.
[26] Data are revised to take account of estimated underregistration of births.
[27] Data based on results of April 1959 rural sample survey of mortality in 345 villages.

[24] Les données se rapportent à la population née au Brésil et sont calculées à partir de quotients de mortalité reposant sur les taux de survie apparents d'un recensement à l'autre.
[25] Non compris les Amérindiens, au nombre de 16 322 au recensement de 1946.
[26] Données revisées pour tenir compte d'un sous-enregistrement estimatif des naissances.
[27] Données établies à partir des résultats de l'enquête par sondage sur la mortalité (avril 1959) ayant porté sur la population rurale de 345 villages.

[28] Data for age 0 based on infant mortality rates for 1945-1947; for 1-4 years, on mortality rates estimated on basis of "English experience"; for 5 years and over, on mortality rates based on apparent survivorship rates between censuses.

[28] Pour l'âge 0 les données ont été calculées à partir des taux de mortalité infantile concernant 1945-47; pour 1-4 ans, elles sont calculées à partir de quotients de mortalité établis par estimation d'après les observations faites sur la population "anglaise"; pour 5 ans et plus, elles sont calculées à partir de quotients de mortalité reposant sur les taux de survie apparents d'un recensement à l'autre.

[29] Data are for states of Uttar Pradesh, Bihar, Orissa, Assam, Manipur, Madras, Mysore, Travancore-Cochin, Coorg, Bombay, Saurashtra, Kutch, Madhya Pradesh, Madhya Bharat, Hyderabad, Bhopal and Vinhya Pradesh, comprising a population of 294 749 000 in 1951. Values derived from mortality rates implied from apparent survivorship rates between censuses, except that values for ages under 5 and for 60 and over are estimated.

[29] Les données se rapportent aux Etats suivants: Uttar Pradesh, Bihar, Orissa, Assam, Manipur, Madras, Mysore, Travancore-Cochin, Coorg, Bombay, Saurashtra, Kutch, Madhya Pradesh, Madhya Bharat, Hyderabad, Bhopal et Vinhya Pradesh, dont la population totale était de 294 749 000 habitants en 1951. Données calculées à partir de quotients de mortalité reposant sur les taux de survie apparents d'un recensement à l'autre; toutefois, pour les survivants de moins de 5 ans et de 60 ans et plus, les données ont été établies par estimation.

24. Espérance de vie (suite)

[34] For 1931-40, including Finnish nationals outside country; for 1936-1950, data are for Finnish nationals in Finland.

[35] Data are based on mortality rates which exclude war deaths (deaths of civilians and armed forces due to military operations).

[34] 1931-40: y compris les nationaux finlandais hors du pays; 1936-40 et 1946-50: nationaux finlandais se trouvant en Finlande.

[35] Données calculées à partir de quotients de mortalité ne tenant pas compte des pertes de guerre (décès de civils et de militaires dus à des faits de guerre).

[1] Rates based on sample surveys of mortality among about 3.6 per cent of population, except for ages 70 and over, which are estimated.
[2] For age group 1-4 years inclusive.
[3] For the 5-year age group beginning with age specified in boxhead.
[4] Rates based on results of 1955 sample survey of mortality among residents.
[5] For the 10-year age group beginning with lower age specified in boxheads.

[1] Données établies à partir des résultats d'enquêtes par sondage ayant porté sur un échantillon de 3,6 pour 100 environ de la population; toutefois, le nombre de survivants à 70 ans et plus a été calculé à partir de quotients de mortalité établis par estimation.
[2] Groupe d'âge de 1 à 4 ans inclusivement.
[3] Groupe d'âge quinquennal dont la limite inférieure est l'âge indiqué en tête de colonne.
[4] Données établies à partir des résultats de l'enquête par sondage sur la mortalité (1955) ayant porté sur les résidents.
[5] Groupe d'âge décennal dont la limite inférieure est l'âge indiqué en tête de colonne.

25. Quotients de mortalité à un âge donné pour chaque sexe : 1940–1960

[Nombre de décès à l'âge (ou dans l'intervalle d'âges) donné pour 1 000 personnes vivantes ayant atteint cet âge (ou cet intervalle d'âges). Pour les insuffisances des données, voir Notes Techniques, page 95.]

[6] For age group 65-84 years inclusive.
[7] For age group 70-84 years inclusive.
[8] Rates based on results of sample survey of mortality between October 1957 and April 1958 in 69 villages.
[9] Prior to 31 May 1961, known as Union of South Africa.
[10] Rates for ages 1, 2, 3 and 4 years computed on population assumed to have same age distribution as Jamaica 1946.
[11] Prior to 1950, excluding Yukon, Northwest Territories and Newfoundland.

[6] Groupes d'âge de 65 à 84 ans inclusivement.
[7] Groupes d'âge de 70 à 84 ans inclusivement.
[8] Données établies à partir des résultats de l'enquête par sondage sur la mortalité effectuée entre octobre 1957 et avril 1958 dans 69 villages.
[9] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.
[10] Pour 1, 2, 3 et 4 ans, les données ont été calculées pour une population qui est censée avoir la même structure par âge que celle de la Jamaïque en 1946.
[11] Antérieurement à 1950, non compris le Yukon, les Territoires du Nord-Ouest et Terre-Neuve.

[2] For age group 1-4 years inclusive.
[3] For the 5-year age group beginning with age specified in boxhead.
[5] For the 10-year age group beginning with lower age specified in boxheads.
[12] Similarity in mortality and advantages of greater stability in larger numbers led to decision to compile life table on combined experience.
[13] For 85 years and over.

[2] Groupe d'âge de 1 à 4 ans inclusivement.
[3] Groupe d'âge quinquennal dont la limite inférieure est l'âge indiqué en tête de colonne.
[5] Groupe d'âge décennal dont la limite inférieure est l'âge indiqué en tête de colonne.
[12] La mortalité étant comparable dans les deux îles et les grands nombres offrant l'avantage d'une plus grande stabilité, on a décidé de dresser la table de mortalité pour l'ensemble des deux îles.
[13] 85 ans et plus.

25. Quotients de mortalité (suite)

[14] Data are mortality rates based on apparent survivorship rates between census of 1950 and an estimate for 1951 which was constructed on an assumed rate of growth.
[15] For age group 2-4 years inclusive.
[16] Excluding data for Canal Zone; also excluding tribal Indian population, numbering 55 987 in 1940, 48 654 in 1950 and 60 540 in 1960.
[17] Data compiled by Puerto Rico Bureau of Demographic Registry and Statistics.
[18] For 75 years and over.
[19] Excluding Hawaii and, prior to 1959, excluding Alaska.

[14] Données calculées à partir de quotients de mortalité reposant sur les taux de survies apparents pour la population recensée en 1950 et la population de 1951 estimée sur la base d'un taux d'accroissement théorique.
[15] Groupe d'âge de 2 à 4 ans inclusivement.
[16] Non compris la zone du Canal; non compris également les Indiens vivant en tribus, au nombre de 55 987 en 1940, 48 654 en 1950 et 60 540 en 1960.
[17] Données établies par le *Puerto Rico Bureau of Demographic Registry and Statistics.*
[18] 75 ans et plus.
[19] Non compris Hawaii et, antérieurement à 1959, non compris l'Alaska.

25. Life table mortality rates (continued)

[2] For age group 1-4 years inclusive.
[3] For the 5-year age group beginning with age specified in boxhead.
[5] For the 10-year age group beginning with lower age specified in boxheads.
[13] For 85 years and over.
[15] For age group 2-4 years inclusive.
[18] For 75 years and over.
[20] Rates for ages under 5 years estimated on the basis of the distribution of deaths under 5 years for Trinidad and Tobago.

[2] Groupe d'âge de 1 à 4 ans inclusivement.
[3] Groupe d'âge quinquennal dont la limite inférieure est l'âge indiqué en tête de colonne.
[5] Groupe d'âge décennal dont la limite inférieure est l'âge indiqué en tête de colonne.
[13] 85 ans et plus.
[15] Groupe d'âge de 2 à 4 ans inclusivement.
[18] 75 ans et plus.
[20] Les quotients pour les moins de 5 ans ont été calculés par estimation d'après la distribution des décès de moins de 5 ans à la Trinité et à Tobago.

[21] Comprising Antigua, Montserrat, St. Kitts-Nevis and Anguilla, and the Virgin Islands (UK), the last of which is not part of the West Indies Federation.
[22] Data are mortality rates for population born in Brazil implied from apparent survivorship rates between censuses.
[23] Excluding Amerindians, numbering 16 322 at 1946 census.
[24] Rates are estimates based on results of April 1959 rural sample survey of mortality in 345 villages.

[21] Y compris Antigua, Montserrat, St-Christophe-Nevis et Anguilla et les Iles Vierges (R-U), ces dernières ne faisant pas partie de la Fédération des Indes-Occidentales.
[22] Les données se rapportent à la population née au Brésil et sont calculées à partir de quotients de mortalité reposant sur les taux de survie apparents d'un recensement à l'autre.
[23] Non compris les Amérindiens, au nombre de 16 322 au recensement de 1946.
[24] Données établies à partir des résultats de l'enquête par sondage sur la mortalité (avril 1959) ayant porté sur la population rurale de 345 villages.

[2] For age group 1-4 years inclusive.
[3] For the 5-year age group beginning with age specified in boxhead.
[15] For age group 2-4 years inclusive.
[18] For 75 years and over.
[25] For 70 years and over.
[26] For 80 years and over.
[27] Rate for age 0 is average of infant mortality rates for 1945-1947; for 1-4 years, estimated on basis of "English experience"; for 5 years and over, based on apparent survivorship rates between censuses.

[2] Groupe d'âge de 1 à 4 ans inclusivement.
[3] Groupe d'âge quinquennal dont la limite inférieure est l'âge indiqué en tête de colonne.
[15] Groupe d'âge de 2 à 4 ans inclusivement.
[18] 75 ans et plus.
[25] 70 ans et plus.
[26] 80 ans et plus.
[27] Pour l'âge 0, les données ont été calculées à partir des taux de mortalité infantile concernant 1945-1947; pour 1-4 ans, elles sont calculées à partir de quotients de mortalité établis par estimation d'après les observations faites sur la population "anglaise"; pour 5 ans et plus, elles sont calculées à partir de quotients de mortalité reposant sur les taux de survie apparents d'un recensement à l'autre.

25. Quotients de mortalité (suite)

[28] Data are for States of Uttar Pradesh, Bihar, Orissa, Assam, Manipur, Madras, Mysore, Travancore-Cochin, Coorg, Bombay, Saurashtra, Kutch, Madhya Pradesh, Madhya Bharat, Hyderabad, Bhopal and Vinhya Pradesh, comprising a population of 294 749 000 in 1951. Data are based on apparent survivorship rates between censuses, except that rates for ages under 5 and for 60 years and over are estimated.

[29] Data are for Jewish population of Palestine. For data relating to Moslem population, see Palestine below. Data are less reliable than those for later years.

[30] Data are for Japanese nationals only in territory as of period specified.

[31] Specific rates are estimates.

[32] For 60 years and over.

[28] Les données se rapportent aux états suivants: Uttar Pradesh, Bihar, Orissa, Assam, Manipur, Madras, Mysore, Travancore-Cochin, Coorg, Bombay, Saurashtra, Kutch, Madhya Pradesh, Madhya Bharat, Hyderabad, Bhopal et Vinhya Pradesh, dont la population totale était de 294 749 000 habitants en 1951. Données calculées sur les taux de survie apparents d'un recensement à l'autre; toutefois, pour les survivants à moins de 5 ans et à 60 ans et plus, les données ont été établies par estimation.

[29] Population juive de Palestine. Pour les données relatives à la population musulmane, voir plus bas sous Palestine. Les données pour les années antérieures sont de moins bonne qualité.

[30] Données se rapportant uniquement aux nationaux japonais se trouvant sur le territoire à la période indiquée.

[31] Taux spécifiques établis par estimation.

[32] 60 ans et plus.

25. Life table mortality rates (continued)

[2] For age group 1-4 years inclusive.
[3] For the 5-year age group beginning with age specified in boxhead.
[13] For 85 years and over.
[18] For 75 years and over.
[26] For 80 years and over.
[30] Data are for Japanese nationals only in territory as of period specified.
[31] Specific rates are estimates.

[2] Groupe d'âge de 1 à 4 ans inclusivement.
[3] Groupe d'âge quinquennal dont la limite inférieure est l'âge indiqué en tête de colonne.
[13] 85 ans et plus.
[18] 75 ans et plus.
[26] 80 ans et plus.
[30] Données se rapportant uniquement aux nationaux japonais se trouvant sur le territoire à la période indiquée.
[31] Taux spécifiques établis par estimation.

[32] For 60 years and over.
[33] Territory formerly under British mandate. Reliability of rates affected by deficiencies in basic data.
[34] Excluding nomad population; for rates among Jewish population, see Israel above.
[35] Sixty-three provincial capitals only.
[36] Excluding Faeroe Islands and Greenland.

[32] 60 ans et plus.
[33] Territoire précédemment sous mandat britannique. Les données sont de qualité discutable en raison des insuffisances des statistiques de base.
[34] Non compris les nomades; pour les données relatives à la population juive, voir plus haut sous Israël.
[35] 63 capitales de province seulement.
[36] Non compris les îles Féroé et le Groenland.

25. Life table mortality rates (continued)

* Provisional.
[2] For age group 1-4 years inclusive.
[3] For the 5-year age group beginning with age specified in boxhead.
[37] For 1931-40, including Finnish nationals outside country; for 1936-1950, data are for Finnish nationals in Finland.
[38] Rates include war deaths (deaths of civilians and armed forces due to military operations).

* Données provisoires.
[2] Groupe d'âge de 1 à 4 ans inclusivement.
[3] Groupe d'âge quinquennal dont la limite inférieure est l'âge indiqué en tête de colonne.
[37] 1931-40: y compris les nationaux finlandais hors du pays; 1936-1950: les données ne concernent que les nationaux finlandais en Finlande.
[38] Quotients calculés en tenant compte des pertes de guerre (décès de civils et de militaires dus à des faits de guerre).

25. Quotients de mortalité (suite)

[38] Rates include war deaths (deaths of civilians and armed forces due to military operations).
[39] Rates exclude war deaths (deaths of civilians and armed forces due to military operations).
[42a] Fluctuations in rates due to inaccuracies in age reporting.

[38] Quotients calculés en tenant compte des pertes de guerre (décès de civils et de militaires dus à des faits de guerre).
[39] Quotients calculés sans tenir compte des pertes de guerre (décès de civils et de militaires dus à des faits de guerre).
[42a] Les fluctuations dans les taux sont dues aux inexactitudes dans les déclarations d'âge.

25. Life table mortality rates (continued)

[See note at head of table.]

[43] Excluding full-blooded aborigines, estimated at 39 319 in June 1954.

[43] Non compris les aborigènes purs, au nombre de 39 319 en juin 1954 (estimation).

26. Survivors at specified ages for each sex : 1940–1960

[Number of persons who would survive to the exact age specified, out of 100 000 born alive and subject to mortality conditions of period indicated. For limitations of data, see Technical Notes, page 42.]

[1] Data based on results of sample surveys of mortality among about 3.6 per cent of total population. Survivors at age 70 years and over calculated from estimated mortality rates.
[2] Data based on results of 1955 sample survey of mortality among residents.
[3] Data are survivors out of 1 000 born alive.
[4] Data based on results of sample survey of mortality between October 1957 and April 1958 in 69 villages.

[1] Données établies à partir des résultats d'enquêtes par sondage ayant porté sur un échantillon de 3,6 pour 100 environ de la population totale. Le nombre de survivants à 70 ans a été calculé à partir de quotients de mortalité établis par estimation.
[2] Données établies à partir des résultats d'une enquête par sondage sur la mortalité (1955) ayant porté sur les résidents.
[3] Les données représentent le nombre de survivants sur 1 000 nés vivants.
[4] Données établies à partir des résultats de l'enquête par sondage sur la mortalité effectuée entre octobre 1957 et avril 1958 dans 69 villages.

26. Survivants à un âge donné pour chaque sexe : 1940–1960

[Nombre de personnes soumises aux conditions de mortalité de la période indiquée. Pour les insuffisances des données, voir Notes Techniques, page 95.]

[5] Data are survivors out of 10 000 born alive.
[6] Prior to 31 May 1961, known as Union of South Africa.
[7] Survivors at ages 1, 2, 3 and 4 years calculated from mortality rates computed on population assumed to have same age distribution as Jamaica, 1946.
[8] Prior to 1950, excluding Yukon, Northwest Territories and Newfoundland.

[5] Les données représentent le nombre de survivants sur 10 000 nés vivants.
[6] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.
[7] Les nombres de survivants à 1, 2, 3 et 4 ans ont été calculés à partir de quotients de mortalité pour une population qui est censée avoir la même structure par âge que celle de la Jamaïque en 1946.
[8] Antérieurement à l'année 1950, non compris le Yukon, les Territoires du Nord-Ouest et Terre-Neuve.

* Provisional.
[3] Data are survivors out of 1 000 born alive.
[5] Data are survivors out of 10 000 born alive.
[9] Similarity in mortality and advantages of greater stability in larger numbers led to decision to compile life table on combined experience.
[10] Survivors calculated from mortality rates based on apparent survivorship rates between census of 1950 and an estimate for 1951 which was constructed on an assumed rate of growth.

* Données provisoires.
[3] Les données représentent le nombre de survivants sur 1 000 nés vivants.
[5] Les données représentent le nombre de survivants sur 10 000 nés vivants.
[9] La mortalité étant comparable dans les deux îles et les grands nombres offrant l'avantage d'une plus grande stabilité, on a décidé de dresser la table de mortalité pour l'ensemble des deux îles.
[10] Nombres de survivants calculés à partir de quotients de mortalité reposant sur les taux de survie apparents pour la population recensée en 1950 et la population de 1951 estimée sur la base d'un taux d'accroissement théorique.

[11] Excluding data for Canal Zone; also excluding tribal Indian population numbering 55 987 in 1940, 48 654 in 1950 and 60 540 in 1960.
[12] Data compiled by Puerto Rico Bureau of Demographic Registry and Statistics.
[13] Excluding Hawaii and, prior to 1959, excluding Alaska.

[11] Non compris la Zone du Canal; non compris également les Indiens de la jungle, au nombre de 55 987 en 1940, 48 654 en 1950 et 60 540 en 1960.
[12] Données établies par le *Puerto Rico Bureau of Demographic Registry and Statistics.*
[13] Non compris Hawaii et, antérieurement à 1959, l'Alaska.

[3] Data are survivors out of 1 000 born alive.
[14] Survivors at ages under 5 years calculated from estimated mortality rates (see Table 25 for details).
[15] Data are for population born in Brazil and are calculated from mortality rates based on apparent survivorship rates between censuses.

[3] Les données représentent le nombre de survivants sur 1 000 nés vivants.
[14] Les nombres de survivants à moins de 5 ans ont été calculés à partir de quotients de mortalité établis par estimation (voir le détail au tableau 25).
[15] Les données se rapportent à la population née au Brésil et sont calculées à partir de quotients de mortalité reposant sur les taux de survie apparents d'un recensement à l'autre.

[3] Data are survivors out of 1 000 born alive.

[18] Survivors for ages 1-4 years calculated from mortality rates estimated on basis of "English experience"; for 5 years and over, from mortality rates based on apparent survivorship rates between censuses.

[19] Data are for states of Uttar Pradesh, Bihar, Orissa, Assam, Manipur, Madras, Mysore, Travancore-Cochin, Coorg, Bombay, Saurashtra, Kutch, Madhya Pradesh, Madhya Bharat, Hyderabad, Bhopal and Vinhya Pradesh, comprising a population of 294 749 000 in 1951. Data are survivors out of 100 000 alive at age 5. Values for ages under 5 and for 60 years and over are estimated.

[3] Les données représentent le nombre de survivants sur 1 000 nés vivants.

[18] Les nombres de survivants à 1-4 ans sont calculés à partir de quotients de mortalité établis par estimation d'après les observations faites sur la population "anglaise"; pour 5 ans et plus, ils sont calculés à partir de quotients de mortalité reposant sur les taux de survie apparents d'un recensement à l'autre.

[19] Les données se rapportent aux Etats suivants: Uttar Pradesh, Bihar, Orissa, Assam, Manipur, Madras, Mysore, Travancore-Cochin, Coorg, Bombay, Saurashtra, Kutch, Madhya Pradesh, Madhya Bharat, Hyderabad, Bhopal et Vinhya Pradesh, dont la population totale était de 294 749 000 habitants en 1951. Nombres de survivants sur 100 000 vivants à 5 ans. Pour moins de 5 ans et 60 et plus, estimations.

[20] Prior to 1956, data are survivors out of 1 000 born alive; for 1956 and 1957, survivors out of 10 000 born alive.
[21] Data are for Jewish population of Palestine. For data relating to Moslem population, see Palestine below. Data are less reliable than those for later years.
[22] Data are for Japanese nationals only in territory as of period specified.
[23] Survivors calculated from specific rates which are estimates.

[20] Antérieurement à 1956, les données représentent les nombres de survivants sur 1 000 nés vivants; 1956-1957: nombre de survivants sur 10 000 nés vivants.
[21] Population juive de Palestine. Pour les données relatives à la population musulmane, voir plus bas sous Palestine. Les données pour les années antérieures sont de moins bonne qualité.
[22] Données se rapportant uniquement aux nationaux japonais se trouvant sur le territoire à la période indiquée.
[23] Nombres de survivants calculés à partir de taux spécifiques établis par estimation.

[3] Data are survivors out of 1 000 born alive.
[22] Data are for Japanese nationals only in territory as of period specified.
[24] Territory formerly under British mandate. Reliability of values affected by deficiencies in basic data.
[25] Excluding nomad population; for data for Jewish population, see Israel above.

[3] Les données représentent le nombre de survivants sur 1 000 nés vivants.
[22] Données se rapportant uniquement aux nationaux japonais se trouvant sur le territoire à la période indiquée.
[24] Territoire précédemment sous mandat britannique. Les données sont de qualité discutable en raison des insuffisances des statistiques de base.
[25] Non compris les nomades; pour les survivants dans la population juive, voir plus haut sous Israël.

[26] Sixty-three provincial capitals only.
[27] Excluding Greenland, shown separately above, and Faeroe Islands.
[28] For 1931-40, including Finnish nationals outside country; for 1936-1950, data are for Finnish nationals in Finland.
[29] Survivors calculated from mortality rates which exclude war deaths (deaths of civilians and armed forces due to military operations).

[26] Soixante-trois capitales de provinces seulement.
[27] Non compris le Groenland, qui fait l'objet d'une rubrique distincte (voir plus haut), ni les îles Féroé.
[28] 1931-40: Y compris les nationaux finlandais hors du pays; 1936-1950, nationaux finlandais se trouvant en Finlande.
[29] Nombres de survivants calculés à partir de quotients de mortalité ne tenant pas compte des pertes de guerre (décès de civils et de militaires dus à des faits de guerre).

26. Survivors (continued)

* Provisional.

[5] Data are survivors out of 10 000 born alive.

[28] For 1931-40, including Finnish nationals outside country; for 1936-1950, data are for Finnish nationals in Finland.

[29] Survivors calculated from mortality rates which exclude war deaths (deaths of civilians and armed forces due to military operations).

* Données provisoires.

[5] Les données représentent le nombre de survivants sur 10 000 nés vivants.

[28] 1931-40: Y compris les nationaux finlandais hors du pays; 1936-1950, nationaux finlandais se trouvant en Finlande.

[29] Nombres de survivants calculés à partir de quotients de mortalité ne tenant pas compte des pertes de guerre (décès de civils et de militaires dus à des faits de guerre).

26. Survivants (suite)

[5] Data are survivors out of 10 000 born alive.
[29] Survivors calculated from mortality rates which exclude war deaths (deaths of civilians and armed forces due to military operations).

[5] Les données représentent le nombre de survivants sur 10 000 nés vivants.
[29] Nombres de survivants calculés à partir de quotients de mortalité ne tenant pas compte des pertes de guerre (décès de civils et de militaires dus à des faits de guerre).

26. Survivants (suite)

[5] Data are survivors out of 10 000 born alive.

[34] Except for 1950-52, data are survivors out of 10 000 born alive.

[5] Les données représentent le nombre de survivants sur 10 000 nés vivants.

[34] Sauf pour les années 1950-52, les données représentent le nombre de survivants pour 10 000 nés vivants.

[36] Data include population outside country.
[37] Excluding full-blooded aborigines, estimated at 39 319 in June 1954.

[36] Y compris les nationaux hors du pays.
[37] Non compris les aborigènes purs, au nombre de 39 319 en juin 1954 (estimation).

27. Marriages and crude marriage rates : 1952-1961

[Rates are the number of legal (recognized) marriages performed and registered, i.e., excluding unions established by mutual consent or by tribal or native custom, per 1 000 population. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 43.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year or registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[2] Including the two Departments of the Sahara.
[3] Rates computed on population excluding personnel in military establishments.
[4] Note suppressed.
[5] Excluding Southern Cameroons, which was formerly a part of United Nations Trust Territory of the Cameroons under British Administration and which became part of the Republic of Cameroun on 1 October 1961.
[6] Northern part of former Spanish Protectorate.
[7] The former French Protectorate.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[2] Y compris les deux départements du Sahara.
[3] Taux calculés sur la base de la population totale non compris les personnes employées dans les établissements militaires.
[4] Note supprimée.
[5] Non compris le Cameroun méridional qui faisait précédemment partie du Territoire sous tutelle du Cameroun sous administration britannique et qui est devenu partie intégrante de la République du Cameroun, le 1er octobre 1961.
[6] Partie nord de l'ancien Protectorat espagnol.
[7] Ancien Protectorat français.

27. Mariages et taux bruts de nuptialité : 1952-1961

[Les taux représentent le nombre de mariages reconnus par la loi — non compris les unions formées par consentement mutuel ou selon la coutume tribale ou indigène — qui ont été célébrés et enregistrés pour 1 000 habitants. Les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et les insuffisances des données, voir Notes Techniques, page 96.]

										Swaziland
5.7	*4.6*	*4.7*	*4.1*	*5.4*	*4.9*	*4.6*	*4.1*	*4.9*	...	Population européenne

[8] Population which has fulfilled certain conditions established by law, i.e., achieved a prescribed degree of material and social development, as measured by educational level, language and mode of living.
[9] Registration not compulsory; believed to be complete for civilized population only, which represents a relatively small proportion of the total.
[10] Prior to 31 May 1961, known as Union of South Africa.
[11] Mixed marriages (primarily between Coloured and Bantu) are included with "Coloured"; these, in 1950-1956, numbered 911, 972, 1 035, 1 006, 1 142, 1 640 and 996, respectively.
[12] Data are civil and religious marriages only; they thus exclude Bantu customary marriages *(lobola)* which are accepted as legal but for which civil registration is not provided.
[13] For non-white population only.
[14] Data exclude marriages between Moroccans, but rates are computed on population including them.

[8] Population remplissant certaines conditions fixées par la loi, c'est-à-dire ayant atteint un degré de développement matériel et social déterminé du point de vue du niveau d'instruction, de la langue parlée et du mode de vie.
[9] L'enregistrement des mariages n'est pas obligatoire; il n'est vraisemblablement complet que pour la population "civilisée" qui représente une fraction relativement faible de la population totale.
[10] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.
[11] Les mariages mixtes (principalement entre personnes de couleur et Bantous) sont classés comme mariages de personnes de couleur; pour les années 1950-1956, leur nombre s'établit comme suit: 911; 972; 1 035; 1 006; 1 142; 1 640 et 996 respectivement.
[12] Statistiques établies uniquement d'après le nombre des mariages civils et religieux enregistrés; il n'est donc pas tenu compte des mariages contractés selon la coutume bantoue *(lobola)*, qui sont juridiquement valables, mais dont l'inscription au registre d'état civil n'est pas prévue.
[13] Les données ne concernent que la population non blanche.
[14] Non compris les mariages entre Marocains. Toutefois, les taux sont calculés sur la base d'un chiffre de population qui comprend les Marocains.

27. Marriages and crude marriage rates (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year or registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[15] Marked increases beginning 1953 due to extension of civil-registration facilities.
[16] Between 21 February 1958 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only. The former Syrian Region, which seceded on that date, appears as "Syria" under Asia. Data are for the former Egyptian Region only.
[17] Includes marriages resumed after revocable divorce which approximates legal separation; in 1951, these "re-marriages" numbered 1 611.
[18] Data for some years probably include also marriages resumed after revocable divorce, which is equivalent to legal separation.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[15] Les augmentations sensibles observées depuis 1953 s'expliquent par l'extension des services d'état civil.
[16] 21 février 1958-29 septembre 1961: Région égyptienne et Région syrienne. A partir du 29 septembre 1961, ancienne Région égyptienne seulement, l'ancienne Région syrienne ayant fait sécession à cette date, les données pertinentes figurent en regard de la rubrique "Syrie", sous la rubrique générale "Asie". Données se rapportent à l'ancienne Région égyptienne.
[17] Y compris les unions reconstituées après un divorce révocable, c'est-à-dire après ce qui est à peu près l'équivalent d'une séparation légale; en 1951, le nombre de ces "remariages" a été de 1 611.
[18] Y compris, vraisemblablement, pour certaines années les unions reconstituées après un divorce révocable, c'est-à-dire après ce qui est l'équivalent d'une séparation légale.

27. Mariages et taux bruts de nuptialité (suite)

[19] Rates computed on population excluding tourists and United Kingdom and United States armed forces and their dependants stationed in the area.
[20] Data are marriage licenses issued.
[21] Includes large number of consensual unions formalized in response to special permissive legislation.
[22] Includes large number of consensual unions formalized in response to campaign of Catholic missionaries.
[23] For Aruba, Bonaire and Curaçao only.
[24] Excluding data for Canal Zone, shown separately above; also excluding tribal Indian population, numbering *60 540 in 1960.
[25] Data are estimates based on marriages performed for some areas, and on licenses issued or similar information for other areas.
[26] Marked increase beginning 1953 reflects effect of extension of family allowance act on 31 July 1953 which required proof of civil registration of marriage.

[19] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les touristes ni les militaires du Royaume-Uni et des Etats-Unis et les membres de leur famille les accompagnant.
[20] Statistiques établies d'après le nombre de licences de mariage délivrées.
[21] Compte tenu d'un grand nombre d'unions consensuelles régularisées par suite de la promulgation d'une législation spéciale.
[22] Y compris un grand nombre d'unions consensuelles régularisées à la suite d'une campagne des missionnaires catholiques.
[23] Les données ne concernent qu'Aruba, Bonaire et Curaçao.
[24] Non compris la Zone du Canal qui fait l'objet d'une rubrique distincte (voir plus haut); à l'exclusion aussi des Indiens vivant en tribus, au nombre de *60 540 en 1960.
[25] Données résultant d'estimations établies sur la base du nombre des mariages célébrés dans certaines régions et du nombre des licences délivrées ou des inscriptions du même ordre dans d'autres régions.
[26] Les augmentations sensibles observées depuis 1953 s'expliquent par l'entrée en vigueur, le 31 juillet 1953, de dispositions nouvelles exigeant que les bénéficiaires des allocations familiales aient fait enregistrer leur mariage à l'état civil.

Italics: Data are unreliable or of unknown completeness.

* Provisional.

† Data tabulated by year or registration rather than occurrence.

[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.

[8] Population which has fulfilled certain conditions established by law, i.e., achieved a prescribed degree of material and social development, as measured by educational level, language and mode of living.

[18] Data for some years probably include also marriages resumed after revocable divorce, which is equivalent to legal separation.

[27] Except for Bogotá, data are marriages recorded in Roman Catholic church registers only.

[28] Excluding Indian jungle population. Prior to 1955, data exclude marriages in Galápagos Islands and, prior to 1954, also those in Provinces of Napo Pastaza, Morona Santiago and Zamora Chinchipe, but rates are computed on total population.

[29] Prior to 1954, data tabulated by year of registration rather than occurrence.

[30] Excluding Indian jungle population, estimated at 453 200 on 31 December 1954.

[31] Excluding Indian and Negro population living in tribes, estimated at 26 000 in 1952-1956 and 38 000 in 1959. Data are civil marriages only, i.e., excluding Hindu and Moslem ritual marriages, recognized by law in 1940.

[32] Excluding Indian jungle population, numbering 56 705 in 1950 and estimated at 31 800 in 1961.

[33] Kandyan marriages are completely registered; registration of Moslem and general marriages is fairly complete.

[34] Excluding armed forces and foreigners.

[35] Marriage statistics not compiled prior to 1955. For 1955-1957, data are non-Moslem civil marriages; beginning 1958, data include also marriages under Christian Marriage Ordinance which came into effect 1 August 1957.

[36] Data are for years ended 21 December.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.

* Données provisoires.

† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.

[8] Population remplissant certaines conditions fixées par la loi, c'est-à-dire ayant atteint un degré de développement matériel et social déterminé du point de vue du niveau d'instruction, de la langue parlée et du mode de vie.

[18] Y compris, vraisemblablement, pour certaines années, les unions reconstituées après un divorce révocable, c'est-à-dire après ce qui est l'équivalent d'une séparation légale.

[27] À l'exception de Bogota, les statistiques sont établies d'après le nombre des mariages inscrits sur les registres des églises catholiques romaines seulement.

[28] Il n'est pas tenu compte des Indiens de la jungle. Non compris les mariages célébrés dans les îles Galapagos, pour les années antérieures à 1955, ni dans les provinces de Napo Pastaza, Morona Santiago et Zamora Chinchipe, pour les années antérieures à 1954; toutefois, les taux ont été calculés sur la base de la population totale.

[29] Pour les années antérieures à 1954, les statistiques sont établies selon l'année de l'enregistrement et non l'année de l'événement.

[30] Non compris les Indiens de la jungle, au nombre de 453 200 au 31 décembre 1954 (estimation).

[31] Non compris les Indiens et les noirs vivant en tribus: 26 000 en 1952-1956 et 38 000 en 1959 (estimations). Mariages civils seulement, c'est-à-dire non compris les mariages hindous et musulmans, reconnus par la loi en 1940.

[32] Non compris les Indiens de la jungle au nombre de 56 705 en 1950 et 31 800 en 1961 (estimation).

[33] Tous les mariages de Kandyens sont enregistrés; l'enregistrement des mariages musulmans et des autres mariages est relativement complet.

[34] Non compris les militaires ni les étrangers.

[35] Les statistiques de la nuptialité n'ont été établies qu'à partir de 1955. Pour 1955-1957, les statistiques sont établies d'après le nombre des mariages civils non musulmans; à partir de 1958, il est tenu compte aussi des mariages célébrés conformément à la *Christian Marriage Ordinance*, entrée en vigueur le 1er août 1957.

[36] Les données se rapportent à des périodes annuelles se terminant le 21 décembre.

27. Mariages et taux bruts de nuptialité (suite)

[Voir note au début du tableau.]

[37] Prior to 1958, excluding Bedouin population in the Negev, estimated at 14 500 in 1959.

[38] Data are for Japanese nationals in Japan only. Prior to May 1952, excluding Tokara Archipelago and prior to 1954 Amami Islands, both acquired from the Ryukyu Islands on 5 December 1951 and 25 December 1953, respectively.

[39] Excluding foreigners but including registered Palestinian refugees. For number of refugees, see Table 4.

[40] Registration estimated to be about 85 per cent complete.

[41] Excluding alien armed forces, civilian aliens employed by armed forces, and foreign diplomatic personnel.

[42] Excluding non-resident foreigners and registered Palestinian refugees. For numbers of refugees, see Table 4.

[43] Data are incomplete returns. In 1953, reports were received from only 66 per cent of local civil registrars; in 1956-1960, from 78, 81, 84, 84 and 88 per cent, respectively. Rates computed on total population.

[43a] Beginning July 1954, excluding marriages in *concelho* of Nagar-Aveli, which had a population of 41 532 in 1950, but rates are computed on total population.

[44] Excluding Allied military and civilian personnel and their dependants stationed in the area.

[45] Prior to 1955, data tabulated by year of registration rather than occurrence.

[46] Prior to 1955, data are civil marriages only, i.e., excluding religious ritual marriages; for 1955, data are civil and Christian ritual marriages; beginning 1956, data are civil, Christian and Moslem ritual marriages. Rates computed on population excluding transients afloat and non-locally domiciled military and civilian services personnel and their dependants.

[47] Formerly Syrian Region of United Arab Republic; reverted to status of independent nation 29 September 1961. Excluding Palestinian refugees, numbering 124 261 on 1 July 1960; for number excluded 1952-1959, see Table 4. Data exclude also nomads, estimated at 179 722 at end of 1956, but rates computed on population including them.

[48] Data are for changing territory representing 98 per cent of total population in 1958.

[49] Not computed by the Statistical Office of the United Nations.

[37] Pour les années antérieures à 1958, non compris les Bédouins du Négeb: 14 500 en 1959 (estimation).

[38] Ne concerne que les nationaux japonais se trouvant au Japon. Pour la période antérieure à mai 1952, non compris l'archipel des Tokara et, pour les années antérieures à 1954, les îles Amami, détachés des îles Ryû-kyû et rattachés au Japon le 5 décembre 1951 et le 25 décembre 1953 respectivement.

[39] Non compris les étrangers, mais y compris les réfugiés palestiniens immatriculés. Pour le nombre de réfugiés, voir le tableau 4.

[40] L'enregistrement saisirait 85 pour 100 environ des mariages.

[41] Non compris les militaires et civils étrangers employés par les forces armées et les membres du corps diplomatique étranger.

[42] Non compris les étrangers non résidents et les réfugiés Palestiniens immatriculés. Pour le nombre de réfugiés, voir le tableau 4.

[43] Données incomplètes. En 1953, des bulletins n'ont été reçus que de 66 p. 100 des bureaux d'état civil et, en 1956-1960, de 78, 81, 84, 84 et 88 p. 100 de ces bureaux respectivement. Taux calculés sur la base de la population totale.

[43a] A partir de juillet 1954 non compris les mariages célébrés dans le *concelho* de Nagar-Aveli, dont la population était de 41 532 en 1950; toutefois les taux ont été calculés sur la base de la population totale.

[44] Non compris les militaires et agents civils alliés en poste sur le territoire, ni les membres de leur famille les accompagnant.

[45] Pour les années antérieures à 1955, les statistiques sont établies selon l'année de l'enregistrement et non l'année de l'événement.

[46] Pour les années antérieures à 1955, mariages civils seulement, c'est-à-dire non compris les mariages religieux; pour 1955, mariages civils et chrétiens; à partir de 1956, mariages civils, chrétiens et musulmans. Taux calculés sur la base d'un chiffre de population qui ne comprend pas les personnes de passage à bord de bateaux, ni les militaires et les fonctionnaires civils non domiciliés sur le territoire, ainsi que les personnes à leur charge les accompagnant.

[47] Ancienne Région syrienne de la République arabe unie, redevenue Etat indépendant le 29 septembre 1961. Non compris les réfugiés de Palestine au nombre de 124 261 au 1er juillet 1960; pour le nombre de réfugiés omis chaque année de 1952-1959, voir le tableau 4. Non compris la population nomade, soit 179 722 (estimation) à la fin de 1956; toutefois les taux sont calculés sur la base d'un chiffre de population les comprenant.

[48] Les données se rapportent à des zones variables comptant 98 pour 100 de la population totale en 1958.

[49] Ce taux n'a pas été calculé par le Bureau de statistique des Nations Unies.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year or registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[50] Excluding aliens temporarily in the area.
[51] Data include marriages among armed forces stationed outside country and among alien armed forces in the area unless performed by local foreign authority.
[52] Data include marriages of Bulgarian nationals outside the country, but exclude those of aliens in the area.
[53] Excluding Faeroe Islands and Greenland, shown separately.
[54] Data are marriages in which the bride was domiciled in Finland. Rates computed on population comprising Finnish nationals in Finland and those temporarily outside the country.
[55] Data include marriages among armed forces stationed outside country; rates computed on population excluding alien armed forces stationed in the area and members of career military service outside country unless on duty in Germany or Austria.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[50] Non compris les étrangers se trouvant temporairement sur le territoire.
[51] Y compris les mariages de militaires nationaux hors du pays et les mariages de militaires étrangers en garnison sur le territoire, sauf s'ils ont été célébrés par l'autorité étrangère.
[52] Y compris les mariages de Bulgares célébrés à l'étranger mais non compris les mariages d'étrangers célébrés sur le territoire.
[53] Non compris les îles Féroé et le Groenland qui font l'objet de rubriques distinctes.
[54] Les données ne comprennent que les mariages où la femme était domiciliée en Finlande. Taux calculés sur la base d'un chiffre de population comprenant les nationaux finlandais qui se trouvaient en Finlande ainsi que ceux qui étaient temporairement absents.
[55] Y compris les mariages de militaires nationaux hors du pays; taux calculés sur la base d'un chiffre de population qui ne comprend ni les militaires étrangers en garnison sur le territoire, ni les militaires nationaux de carrière hors du pays sauf ceux qui étaient en poste en Allemagne ou en Autriche.

27. Mariages et taux bruts de nuptialité (suite)

[Voir note au début du tableau.]

[56] Rates computed on population excluding armed forces.
[57] Rates computed on population including armed forces outside country and excluding alien armed forces stationed in the area.
[58] Prior to 1956, data tabulated by year of registration rather than occurrence.
[59] Data include marriages among armed forces stationed outside country, but rates are computed on population excluding non-Maltese armed forces stationed in the area and including civilian nationals temporarily outside country.
[60] Includes marriages occurring outside country if registered in a Netherlands population register within one year.
[61] Data are marriages in which the groom was domiciled in Norway.
[62] Excluding full-blooded aborigines, estimated at 39 319 in June 1954.
[63] Prior to 1959, data are for years ended 31 March and rates are computed on population as of 30 September of previous year.

[56] Taux calculés sur la base d'un chiffre de population, non compris les militaires.
[57] Taux calculés sur la base d'un chiffre de population qui comprend les militaires nationaux hors du pays mais non les militaires étrangers en garnison sur le territoire.
[58] Pour les années antérieures à 1956, les statistiques sont établies selon l'année de l'enregistrement et non l'année de l'événement.
[59] Y compris les mariages de militaires nationaux hors du pays; taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires non maltais en garnison sur le territoire mais qui comprend les civils nationaux temporairement hors du pays.
[60] Y compris les mariages célébrés à l'étranger, à condition qu'ils aient été inscrits sur un registre de population néerlandais au cours de l'année qui a suivi la célébration.
[61] Les données ne comprennent que les mariages où l'époux était domicilié en Norvège.
[62] Non compris les aborigènes purs, au nombre de 39 319 en juin 1954 (estimation).
[63] Pour les années antérieures à 1959, les données se rapportent à des périodes annuelles se terminant le 31 mars, mais les taux sont calculés sur la base de la population au 30 septembre de l'année précédente.

27. Marriages and crude marriage rates (continued)

[See note at head of table.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year or registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[49] Not computed by The Statistical Office of The United Nations.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[49] Ce taux n'a pas été calculés par le Bureau de statistique des Nations Unies.

27. Mariages et taux bruts de nuptialité (suite)

[Voir note au début du tableau.]

[64] Including data for Condominium of Canton and Enderbury Islands.
[65] Excluding United States military personnel, their dependants and contract employees.
[66] Excludes marriages in Rota, but rates computed on population including that of Rota.
[67] Includes data for Rota.
[68] For 1953-1957, data are for Tongan population only.

[64] Y compris les mariages dans la population du Condominium des îles Canton et Enderbury.
[65] Non compris les militaires des Etats-Unis et les membres de leur famille ni les agents contractuels des Etats-Unis.
[66] Non compris les mariages célébrés dans Rota, toutefois les taux sont calculés sur la base d'un chiffre de population comprenant Rota.
[67] Y compris Rota.
[68] 1953-1957: Les données ne concernent que les Tongans.

28. Marriages by age of bride and by age of groom : latest available year.

[Data are legal (recognized) marriages performed and registered, i.e., excluding unions established by mutual consent or by tribal or native custom. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 43.]

Italics: Data are unreliable or of unknown completeness.
† Data tabulated by year of registration rather than occurrence.
[1] Age below which marriage is unlawful or invalid without dispensation by competent authority.
[2] Excluding the two Departments of the Sahara.
[3] Data are marriages recorded in religious registers only.
[4] For under 16 years.
[5] For 16-21 years.
[6] For 22 years and over.
[7] Northern part of former Spanish Protectorate.
[8] The former French Protectorate.
[9] Population which has fulfilled certain conditions established by law, i.e., achieved a prescribed degree of material and social development, as measured by educational level, language and mode of living.
[10] Age classification based on difference between year of birth and year of marriage.
[11] Prior to 31 May 1961, known as Union of South Africa.
[12] Mixed marriages (primarily between Coloured and Bantu) are included with "Coloured". For number, both sexes, see Table 27.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Age au-dessous duquel le mariage est illégal ou nul, en l'absence de dispense accordée par l'autorité compétente.
[2] Non compris les deux départements du Sahara.
[3] Statistiques établies d'après le nombre de mariages inscrits sur les registres religieux.
[4] Moins de 16 ans.
[5] 16-21 ans.
[6] 22 ans et plus.
[7] Partie nord de l'ancien Protectorat espagnol.
[8] Ancien Protectorat français.
[9] Population remplissant certaines conditions fixées par la loi, c'est-à-dire ayant atteint un degré de développement matériel et social déterminé du point de vue du niveau d'instruction, de la langue parlée et du mode de vie.
[10] Répartition par âge basée sur la différence entre l'année de naissance et l'année de mariage.
[11] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.
[12] Les mariages mixtes (principalement entre personnes de couleur et Bantous) sont classés comme mariages de personnes de couleur. Pour leur nombre, sans répartition selon le sexe, voir le tableau 27.

28. Mariages selon l'âge de l'épouse et selon l'âge de l'époux : dernière année disponible.

[Les données représentent le nombre de mariages reconnus par la loi qui ont été célébrés et enregistrés, non compris les unions formées par consentement mutuel ou selon la coutume tribale ou indigène. Les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et les insuffisances des données, voir Notes Techniques, page 97.]

[13] For 16-20 years.
[14] For 21-24 years.
[15] For under 18 years.
[16] For 18-20 years.
[17] Data are civil and religious marriages only; they thus exclude Bantu customary marriages *(lobola)* which are accepted as legal but for which civil registration is not provided.
[18] For 16-19 years.
[19] For 18-19 years.
[20] Data exclude marriages between Moroccans.
[21] Between 21 February 1958 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only. Data are for the former Egyptian Region and include marriages resumed after "revocable divorce" which is roughly equivalent to "legal separation".
[22] Varies among major civil divisions, or ethnic or religious groups.

[13] 16-20 ans.
[14] 21-24 ans.
[15] Moins de 18 ans.
[16] 18-20 ans.
[17] Statistiques établies uniquement d'après le nombre des mariages civils et religieux enregistrés; il n'est donc pas tenu compte des mariages contractés selon la coutume bantoue *(lobola)*, qui sont juridiquement valables, mais dont l'inscription au registre d'état civil n'est pas prévue.
[18] 16-19 ans.
[19] 18-19 ans.
[20] Non compris les mariages entre Marocains.
[21] 21 février 1958-29 septembre 1961: Région égyptienne et Région syrienne. A partir du 29 septembre 1961, ancienne Région égyptienne seulement, l'ancienne Région syrienne ayant fait sécession à cette date, données se rapportent à l'ancienne Région égyptienne, y compris les unions reconstituées après un divorce révocable, c'est-à-dire après ce qui est à peu près l'équivalent d'une séparation légale.
[22] Varie selon les grandes divisions administratives ou selon les groupes ethniques et religieux.

28. Marriages by age of bride and by age of groom (continued)

[23] Data are marriage licenses issued.
[24] Data are for Aruba, Bonaire and Curaçao only.
[25] Excluding data for Canal Zone, shown separately above; also excluding tribal Indian population, numbering *60 540 in 1960.
[26] Data are marriages performed in 29 states only. They are not to be considered as necessarily representative of the United States; among the most populous areas excluded are Illinois, Texas and New York City.

[23] Statistiques établies d'après le nombre de licences de mariage délivrées.
[24] Les données ne concernent qu'Aruba, Bonaire et Curaçao.
[25] A l'exclusion de la Zone du Canal qui fait l'objet d'une rubrique distincte (voir plus haut); non compris également les Indiens vivant en tribus, au nombre de *60 540 en 1960.
[26] Mariages célébrés dans 29 Etats seulement. Ces données ne sont donc pas nécessairement représentatives pour l'ensemble des Etats-Unis; parmi les régions les plus peuplées dont il n'est pas tenu compte, figurent l'Illinois, le Texas et la ville de New York.

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Age below which marriage is unlawful or invalid without dispensation by competent authority.
[4] For under 16 years.
[9] Population which has fulfilled certain conditions established by law, i.e., achieved a prescribed degree of material and social development, as measured by educational level, language and mode of living.
[14] For 21-24 years.
[15] For under 18 years.
[16] For 18-20 years.
[18] For 16-19 years.
[19] For 18-19 years.
[27] Except for Bogotá, data are marriages recorded in Roman Catholic church registers only.
[28] Excluding Indian jungle population.
[29] Excluding Indian jungle population, estimated at 453 200 on 31 December 1954.
[30] Excluding Indian jungle population, numbering 56 705 in 1950.
[31] Data are for Taiwanese nationals only.
[32] Data are non-Moslem civil marriages and Christian ritual marriages only.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] Age au-dessous duquel le mariage est illégal ou nul, en l'absence de dispense accordée par l'autorité compétente.
[4] Moins de 16 ans.
[9] Population remplissant certaines conditions fixées par la loi, c'est-à-dire ayant atteint un degré de développement matériel et social déterminé du point de vue du niveau d'instruction, de la langue parlée et du mode de vie.
[14] 21-24 ans.
[15] Moins de 18 ans.
[16] 18-20 ans.
[18] 16-19 ans.
[19] 18-19 ans.
[27] A l'exclusion de Bogota, les données représentent le nombre de mariages inscrits sur les registres de l'Eglise catholique romaine.
[28] Non compris les Indiens de la jungle.
[29] Non compris les Indiens de la jungle, au nombre de 543 200 au 31 décembre 1954 (estimation).
[30] Non compris les Indiens de la jungle, au nombre de 56 705 en 1950.
[31] Ne concerne que les nationaux taïwanais.
[32] Statistiques établies uniquement d'après le nombre des mariages civils non musulmans et des mariages célébrés selon les rites chrétiens.

28. Mariages selon l'âge de l'épouse et selon l'âge de l'époux (suite)

[33] For under 21 years.
[34] For 21-25 years.
[35] For 26-30 years.
[36] For 31-40 years.
[37] For 41-50 years.
[38] For 51-60 years.
[39] For 61 years and over.
[40] Data are first marriages among Japanese nationals in Japan only.
[41] Excluding foreigners but including registered Palestinian refugees, numbering 613 743 on 30 June.
[42] Excluding alien armed forces, civilian aliens employed by armed forces, and foreign diplomatic personnel.
[43] Data are incomplete, comprising reports received from only 84 per cent of local civil registrars.
[44] Excluding Allied military and civilian personnel and their dependants stationed in the area.
[45] Data are civil and Christian ritual marriages only.
[46] For under 17 years.
[47] For 17-18 years.
[48] For 19-24 years.
[49] Data are for 21 provinces in South Viet-Nam and the Prefecture of Saigon.

[33] Moins de 21 ans.
[34] 21-25 ans.
[35] 26-30 ans.
[36] 31-40 ans.
[37] 41-50 ans.
[38] 51-60 ans.
[39] 61 ans et plus.
[40] Ne concerne que les nationaux japonais se trouvant au Japon; premiers mariages seulement.
[41] Non compris les étrangers, mais y compris les réfugiés palestiniens immatriculés au nombre de 613 743 au 30 juin.
[42] Non compris les militaires et civils étrangers employés par les forces armées et le personnel du corps diplomatique étranger.
[43] Données incomplètes, fondées sur les chiffres communiqués par 84 pour 100 des officiers de l'état civil locaux.
[44] Non compris les militaires et agents civils alliés en poste sur le territoire, ni les membres de leur famille les accompagnant.
[45] Statistiques établies uniquement d'après le nombre des mariages civils et des mariages célébrés selon les rites chrétiens.
[46] Moins de 17 ans.
[47] 17-18 ans.
[48] 19-24 ans.
[49] Les données se rapportent à 21 provinces du sud du Viet-Nam et à la préfecture de Saïgon.

28. Marriages by age of bride and by age of groom (continued)

[51] Data include marriages among armed forces stationed outside country and alien armed forces in the area unless performed by local foreign authority.
[52] Including Bulgarian nationals outside the country but excluding aliens in the area.
[53] Excluding Faeroe Islands and Greenland, shown separately.
[54] Data are marriages in which the bride was domiciled in Finland.
[55] Including armed forces stationed outside country.
[56] Including data for East Berlin.
[57] Data are marriages in which the groom was domiciled in Norway.

[51] Y compris les mariages de militaires nationaux hors du pays et les mariages de militaires étrangers en garnison sur le territoire, sauf s'ils ont été célébrés par l'autorité étrangère.
[52] Y compris les mariages de Bulgares célébrés à l'étranger mais non compris les mariages d'étrangers célébrés sur le territoire.
[53] Non compris les îles Féroé et le Groenland, qui font l'objet de rubriques distinctes.
[54] Les données ne comprennent que les mariages où la femme était domiciliée en Finlande.
[55] Y compris les militaires nationaux hors du pays.
[56] Y compris Berlin-Est.
[57] Les données représentent les mariages où l'époux était domicilié en Norvège.

[22] Varies among major civil divisions, or ethnic or religious groups.
[58] Excluding full-blooded aborigines, estimated at 39 319 in June 1954.

[22] Varie selon les grandes divisions administratives ou selon les groupes ethniques et religieux.
[58] Non compris les aborigènes purs, au nombre de 39 319 en juin 1954 (estimation).

29. Divorces and crude divorce rates : 1952-1961

[Rates are the number of final divorce decrees granted under civil law, per 1 000 population. Annulments and legal separations are excluded, unless otherwise specified. Italics indicate that data are unreliable (incomplete) or of unknown completeness. For method of evaluation and limitations of data, see Technical Notes, page 44.]

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[2] Including the two Departments of the Sahara.
[3] Beginning 1957, rates computed on population excluding personnel in military establishments.
[4] Population which has fulfilled certain conditions established by law, i.e., achieved a prescribed degree of material and social development, as measured by educational level, language and mode of living.
[5] Data include annulments.
[6] Northern part of former Spanish Protectorate. Data are Moslem divorces, including "revocable divorces" which approximate legal separations, but rates are computed on total population of the Zone.
[7] The former French Protectorate. Rates computed on population excluding personnel in military establishments.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[2] Y compris les deux départements du Sahara.
[3] A partir de 1957, taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires encasernés.
[4] Population remplissant certaines conditions fixées par la loi, c'est-à-dire ayant atteint un degré de développement matériel et social déterminé du point de vue du niveau d'instruction, de la langue parlée et du mode de vie.
[5] Y compris les annulations.
[6] Partie nord de l'ancien Protectorat espagnol. Les données représentent les divorces des musulmans, y compris les "divorces révocables", qui sont à peu près l'équivalent de séparations légales, mais les taux sont calculés sur la base de la population totale.
[7] Ancien Protectorat français. Taux calculés sur la base d'un chiffre de population qui ne comprend pas les militaires encasernés.

29. Divorces, nombre et taux bruts : 1952-1961

[Les taux représentent le nombre de jugements de divorce définitifs prononcés par les tribunaux pour 1 000 habitants. Sauf indication contraire, il n'est pas tenu compte des annulations ni des séparations légales. Les données discutables (incomplètes) ou dont le degré de complétude n'est pas connu sont reproduites en italique. Pour la méthode d'évaluation et les insuffisances des données, voir Notes techniques, page 97.]

[8] Prior to 31 May 1961, known as Union of South Africa.
[9] Divorces of mixed unions are included with "Coloured".
[10] Data include annulments and legal separations.
[11] Between 21 February 1958 and 29 September 1961, comprising the Egyptian Region and the Syrian Region; from 29 September 1961, comprising the former Egyptian Region only. The former Syrian Region, which seceded on that date, appears as "Syria" under Asia. Data are for the former Egyptian Region only.
[12] Except for 1954, data include revocable divorces (among Moslem population) which approximate legal separations.
[13] Data are divorces among Christian and Moslem population only and for the latter include "revocable divorces" which approximate legal separations.
[14] Data are petitions for divorce entered in courts.
[15] Rates computed on population excluding tourists and United Kingdom and United States armed forces and their dependants stationed in the area.
[16] For Aruba, Bonaire and Curaçao only.

[8] Antérieurement au 31 mai 1961, connue sous le nom d'Union sud-africaine.
[9] Les ruptures légales d'unions "mixtes" sont classées comme divorces de "personnes de couleur".
[10] Y compris les séparations légales et annulations.
[11] 21 février 1958-29 septembre 1961: Région égyptienne et Région syrienne. A partir du 29 septembre 1961, ancienne Région égyptienne seulement, l'ancienne Région syrienne ayant fait sécession à cette date, les données pertinentes figurent en regard de la rubrique "Syrie" sous la rubrique générale "Asie". Données se rapportent à l'ancienne Région égyptienne.
[12] A l'exception de 1954, les données comprennent les "divorces révocables" (de musulmans), qui sont à peu près l'équivalent de "séparations légales".
[13] Les données représentent uniquement les divorces de chrétiens et de musulmans, y compris pour ces derniers, les "divorces révocables" qui sont à peu près l'équivalent de "séparations légales".
[14] D'après les instances en divorce devant les tribunaux.
[15] Taux calculés sur la base d'un chiffre de population qui ne comprend pas les touristes ni les militaires du Royaume-Uni et des Etats-Unis en garnison sur le territoire et les membres de leur famille les accompagnant.
[16] Les données ne concernent qu'Aruba, Bonaire et Curaçao.

29. Divorces and crude rates (continued)

Italics: Data are unreliable or of unknown completeness.
* Provisional.
† Data tabulated by year of registration rather than occurrence.
[1] Data said to be relatively complete are coded "C"; those said to be unreliable (incomplete) are coded "U". For further details, see Chapter II.
[5] Data include annulments.
[17] Excluding data for Canal Zone, shown separately above; also excluding tribal Indian population, numbering *60 540 in 1960.
[18] Excludes divorces of non-residents.
[19] Data are estimates based on divorces and annulments reported by a varying number of states.
[20] Data include annulments, and divorces among non-permanent residents.
[21] There is no legal provision for "divorce" in the sense used here.
[22] Excluding Indian and Negro population living in tribes, estimated at 26 000 in 1952-1956 and 38 000 in 1959. Data are civil divorces only, excluding dissolutions in accordance with Hindu and Moslem law, which numbered 358 and 60, respectively, in 1951.
[23] Excluding Indian jungle population, numbering 56 705 in 1950.
[24] Excluding armed forces and foreigners.
[25] Data are for years ended 21 December.

Italique: Données discutables ou dont le degré de complétude n'est pas connu.
* Données provisoires.
† Données exploitées selon l'année de l'enregistrement et non l'année de l'événement.
[1] La lettre "C" désigne les données relativement complètes et la lettre "U" les données discutables (incomplètes). Pour plus de détails, voir le chapitre II.
[5] Y compris les annulations.
[17] Non compris la Zone du Canal qui fait l'objet d'une rubrique distincte (voir plus haut); à l'exclusion aussi des Indiens vivant en tribus au nombre de *60 540 en 1960.
[18] Non compris les divorces de non-résidents.
[19] Les données résultent d'estimations établies d'après des chiffres (divorces et annulations) communiqués par un nombre variable d'Etats.
[20] Y compris annulations et divorces parmi les résidents non permanents.
[21] La loi ne prévoit pas le "divorce" au sens où on l'entend ici.
[22] Non compris les Indiens et les noirs vivant en tribus: 26 000 en 1952-1956 et 38 000 en 1959. Les données concernent les divorces prononcés par les tribunaux, non compris les unions dissoutes selon la coutume hindoue ou musulmane, dont le nombre s'établissait respectivement à 358 et 60 en 1951.
[23] Non compris les Indiens de la jungle au nombre de 56 705 en 1950.
[24] Non compris les militaires et les étrangers.
[25] Les données se rapportent à des périodes annuelles se terminant le 21 décembre.

[26] Prior to 1958, excluding Bedouin population in the Negev, estimated at 14 500 in 1959.

[27] Data are for Japanese nationals in Japan only. Prior to May 1952, excluding Tokara Archipelago and prior to 1954, Amami Islands, both acquired from the Ryukyu Islands on 5 December 1951 and 25 December 1953, respectively.

[28] Excluding foreigners but including registered Palestinian refugees. For number of refugees, see Table 4.

[29] Excluding alien armed forces, civilian aliens employed by armed forces, and foreign diplomatic personnel.

[30] Excluding non-resident foreigners and registered Palestinian refugees. For number of refugees, see Table 4.

[31] Excluding Allied military and civilian personnel and their dependants stationed in the area.

[32] Prior to 1955, data tabulated by year of registration rather than occurrence.

[33] Formerly Syrian Region of United Arab Republic; reverted to status of independent nation 29 September 1961. Excluding Palestinian refugees, numbering 124 261 on 1 July 1960; for number excluded 1952-1959, see Table 4. Data exclude also nomads, estimated at 179 722 at end of 1956, but rates computed on population including them.

[34] Data are petitions for divorce and annulment entered in courts.

[26] Pour les années antérieures à 1958, non compris les Bédouins du Négeb.

[27] Ne concerne que les nationaux japonais se trouvant au Japon. Pour la période antérieure à mai 1952, non compris l'archipel des Tokara et, pour les années antérieures à 1954, non compris les îles Amami, détachés des îles Ryû-kyû et rattachés au Japon les 5 décembre 1951 et 25 décembre 1953, respectivement.

[28] Non compris les étrangers mais y compris les réfugiés palestiniens immatriculés. Pour le nombre de réfugiés, voir le tableau 4.

[29] Non compris les militaires et agents civils étrangers employés par les forces armées et le personnel du corps diplomatique étranger.

[30] Non compris les étrangers non résidents et les réfugiés palestiniens immatriculés. Pour le nombre de réfugiés, voir le tableau 4.

[31] Non compris les militaires et agents civils alliés en poste sur le territoire ni les membres de leur famille les accompagnant.

[32] Pour les années antérieures à 1955, données exploitées selon l'année de l'enregistrement et non l'année de l'événement.

[33] Ancienne Région syrienne de la République arabe unie, redevenue Etat indépendant le 29 septembre 1961. Non compris les réfugiés de Palestine au nombre de 124 261 au 1er juillet 1960; pour le nombre de réfugiés omis chaque année, voir le tableau 4. Non compris la population nomade, soit 179 722 (estimation) à la fin de 1956; toutefois les taux sont calculés sur la base d'un chiffre de population les comprenant.

[34] D'après les instances en divorce et annulation devant les tribunaux.

29. Divorces and crude rates (continued)

[See note at head of table.]

[41] Prior to 1956, data include annulments.
[42] Data include divorces granted outside country if registered in a Netherlands population register.
[43] Rates computed on population including armed forces outside country and merchant seamen at sea, but excluding Commonwealth and alien armed forces stationed in the area.
[44] Excluding full-blooded aborigines, estimated at 39 319 in June 1954.
[45] Prior to 1959, data are for years ended 31 March but rates are computed on population as of 30 September of previous year.
[46] Data are petitions for divorce, annulment or separation entered in courts.
[47] Including data for the Condominium of Canton and Enderbury Islands, not available separately.
[48] For 1953-1956, data are for Tongan population only.
[49] For Samoan population only.
[50] Not computed by the Statistical Office of the United Nations.

[41] Pour les années antérieures à 1956 y compris les annulations.
[42] Y compris les divorces prononcés à l'étranger, à condition qu'ils aient été inscrits sur un registre de population néerlandais.
[43] Taux calculés sur la base d'un chiffre de population qui comprend les militaires nationaux hors du pays et les équipages de la marine marchande en mer mais ne comprend pas les militaires du Commonwealth et les militaires étrangers en garnison sur le territoire.
[44] Non compris les aborigènes purs, au nombre de 39 319 en juin 1954.
[45] Pour les années antérieures à 1959, les données se rapportent à des périodes annuelles se terminant le 31 mars, mais les taux sont calculés sur la base de la population au 30 septembre de l'année précédente.
[46] D'après les instances en divorce, annulation ou séparation devant les tribunaux.
[47] Y compris les divorces dans la population du Condominium des îles Canton et Enderbury.
[48] 1953-1956: les données ne concernent que les Tongans.
[49] Ne concerne que les Samoans.
[50] Ces chiffres n'ont pas été calculés par le Bureau de statistique des Nations Unies.

Cumulative Table of Contents:

Subject and time coverage of statistics shown in each issue of the *Demographic Yearbook*, 1949/50–1961

[Unless otherwise indicated, data are shown for each year in time periods. For contents of first issue (1948) see Cumulative Index of 1960 issue, p. 610.]

	Subject — Sujet	Year and issue — 1961 13th – 13ème	1960 12th – 12ème	1959 11th – 11ème	1958 10th – 10ème
	WORLD SUMMARY — APERÇU MONDIAL				
1	Area, density, population by sex [1] and rate of population increase [2] for each country and territory of the world — Superficie, densité, population selon le sexe [1] et taux d'accroissement [2] de la population dans chaque pays et territoire du monde	E: 1953, 1960; latest C – dernier R	E: 1953, 1959; latest C – dernier R	E: 1953, 1958; latest C – dernier R	E: 1953, 1957; latest C – dernier R
2	Area, density, population and rate of increase [2], for the world, continents and regions — Superficie, densité, population, taux d'accroissement [2], pour l'ensemble du monde, les continents et les grandes régions géographiques	1920, 1930, 1940, 1950, 1960	1920, 1930, 1940, 1950, 1959	1920, 1930, 1940, 1950, 1958	1920, 1930, 1940, 1950, 1957
3	Birth and death rates — Taux de natalité et taux de mortalité	1956 – 60	1955 – 59	1954 – 58	1953 – 57

	POPULATION				
	SIZE AND GEOGRAPHIC DISTRIBUTION — EFFECTIF ET REPARTITION GEOGRAPHIQUE				
5	area, population and intercensal rates of increase — superficie, population et taux d'accroissement entre recensements successifs	—	1900 – 1961 [6]	—	—
6	of capital cities and cities of 100 000 or more — des capitales et villes de 100 000 habitants au moins	—	C – R: 1939 – 1961; E: 1955 – 1961	—	—
7	households, numbers of, by size — Nombre de ménages selon la dimension	—	—	—	—
8	by households-size groups — selon la dimension des ménages	—	—	—	—
9	localities, number of, by size — Nombre de localités par groupe d'importance	—	1920 – 1961	—	—
10	by locality-size groups and sex — selon l'importance des localités et le sexe	—	—	—	—
11	by major civil divisions — par grande division administrative	—	—	—	—
12	urban-rural, by sex — urbaine et rurale selon le sexe	—	1920 – 1960 [7]	—	—
13	totals (estimates) — totaux (estimations)	1941 – 1961	1920 – 1960	1940 – 1959	1939 – 1958
	PERSONAL CHARACTERISTICS — CARACTERISTIQUES INDIVIDUELLES				
14	by age groups and sex — par groupe d'âge et selon le sexe: numbers — nombres	1957 – 1961 [8]	1940 – 1960	C – R: 1949 – 1959 [9]; E [10]	C – R: 1945 – 1958 [9]; E [10]
15	percentage distribution — pourcentages	—	—	—	—
16	by age, single years and sex — par année d'âge et selon le sexe	—	—	—	—
17	by marital status, age and sex — selon l'état matrimonial, l'âge et le sexe: numbers — nombres	—	—	—	C – R: 1945 – 1957
18	percentage distribution [10a] — pourcentages [10a]	—	—	—	—

"C" stands for population census result.
"E" stands for population estimate.
[1] Sex distribution shown beginning 1958 issue of the *Yearbook*.
[2] Rate of population increase shown beginning 1957 issue of the *Yearbook*.
[3] By continents only.
[4] Shown in text.
[5] Includes Marriage, Divorce, Birth, Death, Infant mortality, and Natural increase rates; also for 1958 Neo-natal, Post-natal and Maternal mortality, and for 1959, 1960 and 1961 Fertility ratios and Expectation of life.

"R" désigne les résultats des recensements de population.
"E" désigne les estimations de population.
[1] Répartition selon le sexe à partir de l'*Annuaire* de 1958.
[2] Taux d'accroissement à partir de l'*Annuaire* de 1957.
[3] Par continent seulement.
[4] Chiffres donnés dans le texte.
[5] Taux de nuptialité, de divortialité, de natalité, de mortalité, de mortalité infantile et d'accroissement naturel; également, pour 1958, mortalité néonatale, postnatale et maternelle, et, pour 1959, 1960 et 1961, rapports de fécondité et espérance de vie.

Table Cumulative des Matières:

Objet et portée chronologique des statistiques publiées dans l'*Annuaire démographique*, 1949/50–1961

[Sauf indication contraire, les millésimes figurant dans les colonnes sont ceux des années pour lesquelles des statistiques ont été présentées dans chacune des éditions de l'*Annuaire*. Pour le contenu de la première édition (1948), voir l'Index cumulatif de 1960, p. 610.]

UNITED NATIONS NATIONS UNIES

STATISTICAL YEARBOOK 1961

Thirteenth issue of a comprehensive collection of international statistics presented in 186 tables, generally covering the year 1948 and some nine most recent years. The *Yearbook* contains, *inter alia,* statistics relating to: population; structure of mining, manufacturing, construction and electricity and gas industries; production of commodities in agriculture, mining and manufacturing; textile and transport equipment; production, trade and consumption of energy; postal, telegraph and telephone services; civil aviation; tourist travel; external trade of virtually all trading countries; balance of payments; international economic aid; wholesale prices; national income; budget accounts and public debt; housing; medical personnel; educational institutions; newsprint and newspapers; books, films, cinemas and radio and television broadcasting receivers.

The tables are grouped under the following chapter headings:

- Population
- Manpower
- Production summary
- Agriculture
- Forestry
- Fishing
- Mining, quarrying
- Manufacturing
- Construction
- Energy
- Consumptions
- Transport
- Communication
- Internal Trade
- External Trade
- Balance of payments
- International economic aid
- Wages and prices
- National income
- Finance
- Public Finance
- Housing
- Social Statistics
- Education, culture

The *Yearbook* includes also appendices showing conversion factors and alphabetical subject and country indexes.

Prepared by the Statistical Office of the United Nations
(U.N. publication, Sales No.: 62.XVII.1)
9 x 11½ in., 678 pages. Clothbound, $10.00; 71/- stg.; 43 Sw. fr.
Paperbound, $8.00; 57/- stg.; 34.00 Sw. fr.
(See list of distributors at end of volume)

ANNUAIRE STATISTIQUE 1961

Treizième édition d'un vaste recueil de statistiques internationales comportant 186 tableaux et se rapportant généralement à l'année 1948 et aux neuf dernières années. L'*Annuaire* contient notamment des séries sur les sujets suivants: population; structure des industries extractives et manufacturières, de la construction et des industries du gaz et de l'électricité; production de l'agriculture, des industries extractives et des industries manufacturières; équipement de l'industries textile et des transports; énergie: production, commerce et consommation; services postaux, télégraphiques et téléphoniques; aviation civile; tourisme; commerce extérieur de presque tous les pays participant à ce commerce; balance des paiements; aide économique internationale; prix de gros; revenu national; comptes budgétaires et dette publique; habitation; personnel médical; établissements d'enseignement; papier journal et journaux; livres, films, cinémas, radiodiffusion et télévision.

Ces tableaux sont groupés sous les titres suivants:

- Population
- Main-d'oeuvre
- Résumé de la production
- Agriculture
- Forêts
- Pêche
- Industries extractives
- Industries manufacturières
- Construction
- Energie
- Consommation
- Transports
- Communications
- Commerce intérieur
- Commerce extérieur
- Balance des paiements
- Aide économique internationale
- Salaires et prix
- Revenu national
- Finances
- Finances publiques
- Habitation
- Statistiques sociales
- Instruction, culture

L'*Annuaire* contient en annexe une table de conversion, un index alphabétique par sujets et un par pays.

PUBLICATIONS OF THE WORLD HEALTH ORGANIZATION

ANNUAL EPIDEMIOLOGICAL AND VITAL STATISTICS, 1959

This Annual, published by the World Health Organization, is the twelfth of the series. It will appear in the middle of 1962 and will contain about 700 pages of statistical data relating to the year 1959, in three Parts, as follows:

I. General demography and causes of death. Brief information on population (censuses and estimates), natality, general mortality and infant mortality in the various countries. A series of tables, by country, gives absolute figures for deaths, by sex and age groups according to the abridged international list of causes. More detailed tables are, in addition, devoted to important causes of death such as tuberculosis, cancer, cardiovascular diseases, and accidents, and to maternal and infant mortality.

II. Communicable diseases. Revised statistics of cases and deaths notified during the year, including their seasonal fluctuations. With respect to some diseases, the notified cases are given by sex and age group.

III. Medical personnel and hospital establishments. This part gives information concerning number of physicians, dentists, nurses, etc., number, type and capacity of hospitals.

Data on hospital in-patients will be published for the second time, covering the year 1959, because of the increasing demand for information on morbidity.

This volume contains a mass of valuable information on the health of the populations of many countries and territories in so far as it is available and sufficiently reliable to justify publication.

Prepared by the Division of Health Statistics

OF THE WORLD HEALTH ORGANIZATION, GENEVA

PUBLICATIONS DE L'ORGANISATION MONDIALE DE LA SANTE

STATISTIQUES EPIDEMIOLOGIQUES ET DEMOGRAPHIQUES ANNUELLES, 1959

Cet annuaire, le douzième de la série, sera publié par l'Organisation mondiale de la Santé vers le milieu de l'année 1962. Il comportera environ 700 pages d'informations statistiques relatives à l'année 1959, réparties en trois parties:

I. Démographie générale et causes de décès. Informations succinctes sur la population des pays (recensements et estimations), sur la natalité, la mortalité générale et la mortalité infantile. Dans une première série de tableaux par pays, on trouvera les nombres de décès imputables aux différentes causes (d'après la liste abrégée de la nomenclature internationale), répartis selon le sexe et l'âge. D'autres tableaux plus détaillés sont consacrés à certaines causes importantes: tuberculose, cancer, maladies cardio-vasculaires et accidents, ainsi qu'à la mortalité maternelle et à la mortalité infantile.

II. Maladies contagieuses. Statistique revisée des cas et des décès notifiés au cours de l'année, faisant apparaître notamment les fluctuations saisonnières. Pour certaines maladies, les cas notifiés sont répartis selon le sexe et l'âge.

III. Personnel médical et établissements hospitaliers. Cette partie de l'annuaire fournit une documentation sur le nombre des médecins, dentistes, infirmières, etc., ainsi que sur le nombre des hôpitaux, leur type et leur contenance en lits.

Des données sur la statistique des malades hospitalisés seront publiées, pour la seconde fois, couvrant l'année 1959, ceci en vue de répondre à la demande croissante de renseignements sur la morbidité des populations.

Ce volume renferme quantité de renseignements utiles sur l'état sanitaire des populations de nombreux pays et territoires; on s'est efforcé d'en réunir le plus possible et l'on a retenu tous ceux qui paraissaient suffisamment dignes de foi pour être publiés.
